

# A History of Hypertext

# Big technologies and news

- Steam press and broadcasting enabled
  - mass circulation (audience size)
  - rapid, daily circulation (audience synchronization)
  - centralized control through gatekeeping
- Prevented: citizen/user participation

# Mid-20th Century Media Structure: 3 Systems

- Print: minimal regulation, protected by First Amendment, local monopolies
- Broadcast: more regulation, public interest clause, national oligopolies
- Telephone: common carrier regulation, person-to-person only
- Evolution of media-centric political system: polls, sound-bites, and insider baseball

# Newspaper tech 1953

# Digital Convergence

- Digital computers allow for mixing of previously separated types of information
- 1950s and 1960s: centralized mainframe computing
- 1970s: first microcomputers, experimental computer networks

# 1980s

- Macintosh computers and windowing interfaces
- Word Processing and desktop publishing
- Automated typesetting

# The Rise of the WWW

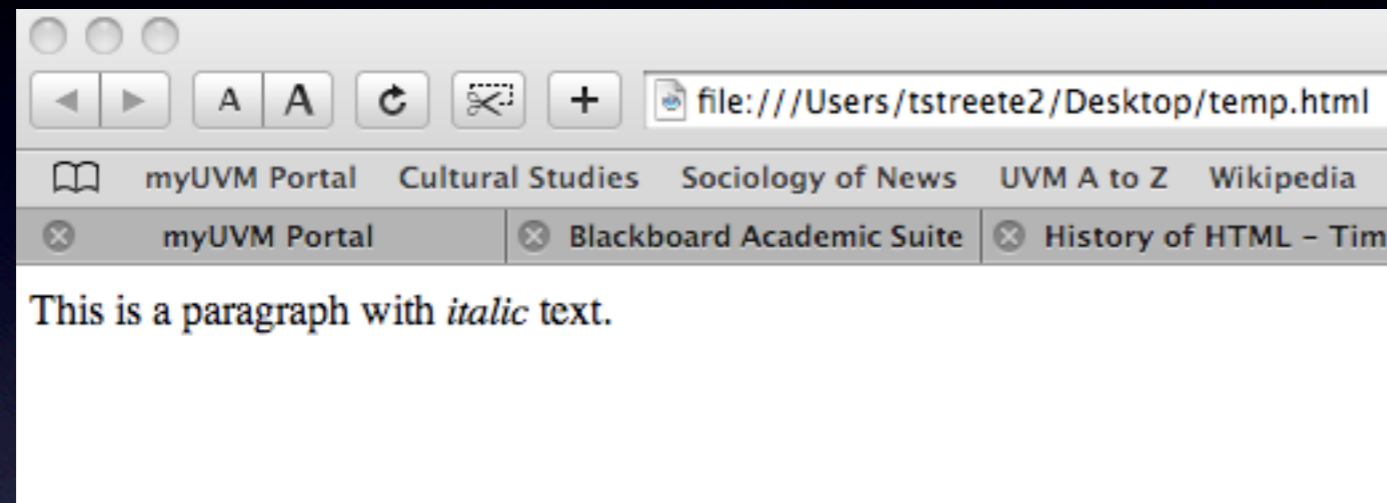

- The experimental internet 1970-1990

# Tim Berners Lee and the WWW

- HTML stands for HyperText Markup Language, it is the authoring language used to create documents on the World Wide Web. HTML is used to define the structure and layout of a Web page, how a page looks and any special functions. HTML does this by using what are called tags that have attributes. For example `<p>` means a paragraph break. As the viewer of a web page you don't see the HTML, it is hidden from your view, however, you do the results.

```
<html>
<body>
This is a paragraph with <span style="font-style: italic;">italic</span>
text. <br>
</body>
</html>
```
