

Final Technical Report on “Chemical Analysis of VMC High Elevation Paired Watershed Study”

Project Director: Donald Ross

Coinvestigators: Beverley Wemple and Jamie Shanley

F-VMC/UVM-03-003

Chemical analyses were conducted on stream samples from West Branch and Ranch Brook collected during the water year of 2002. The results from all three water years are summarized in Table 1 and the specific results, funded by this project, are given in Table 2. As requested, funds were used to measure cations and anions on all archived samples.

Additional analyses were performed on a stream survey of Ranch Brook tributaries between May and July of 2004. Sampling points (Fig. 1a) were selected to provide coverage of subwatersheds within the Ranch Brook basin. Samples were taken on five different dates under differing flow conditions and examined for temporal trends. It is clear that different subwatersheds have strongly contrasting stream chemistry (Fig. 1b). Low pH streams were low in Ca (Fig. 2) and higher in Al (Fig. 3). Nitrate was more variable with a clear seasonal trend (Fig. 4). These results will be used to support a soils study investigating nitrification in different subwatersheds and a graduate student’s study of end-member mixing analysis (attempting to identify sources of stream water).

Methods used were standard techniques with quality control samples run at least once in every 12 analytical samples. The ICP (Perkin-Elmer Optima DV) elements were determined after dilution with nitric acid to give a final concentration of  $0.01 \text{ mol L}^{-1}$ , matching standards and QCs. The samples were not filtered and possible positive errors could occur for both Al and Si. Although, the good relationship between pH and Al (Fig. 3) suggests that error was minimal. The anions were run on a Dionex 600 series ion chromatograph using an AS14A anion separation column and standard conditions.

Figure 1a. Location of stream sampling sites for the survey performed in 2004.

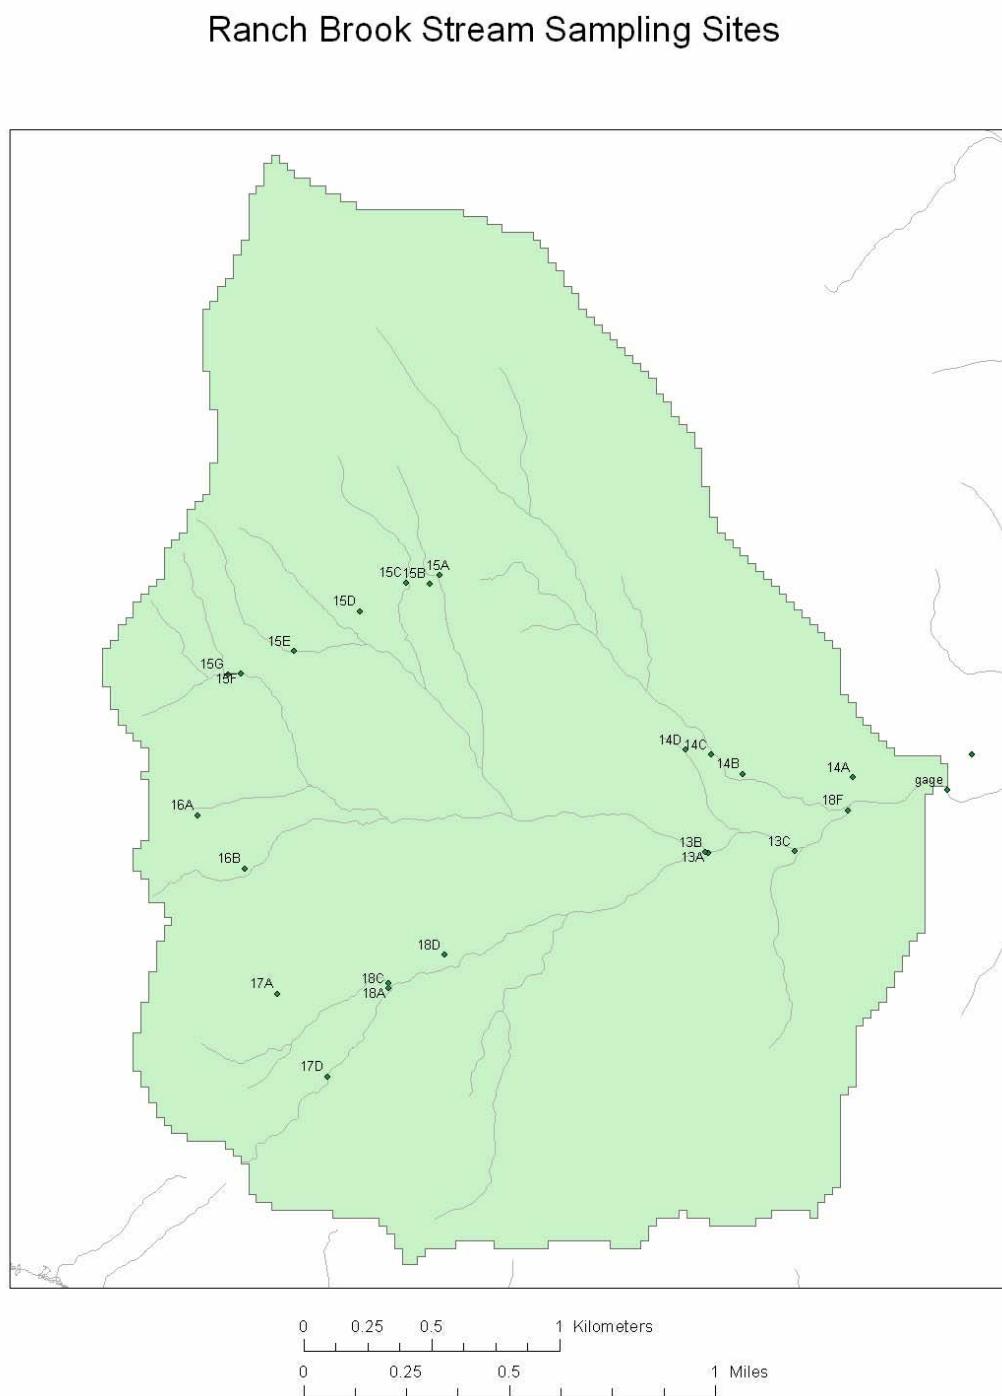

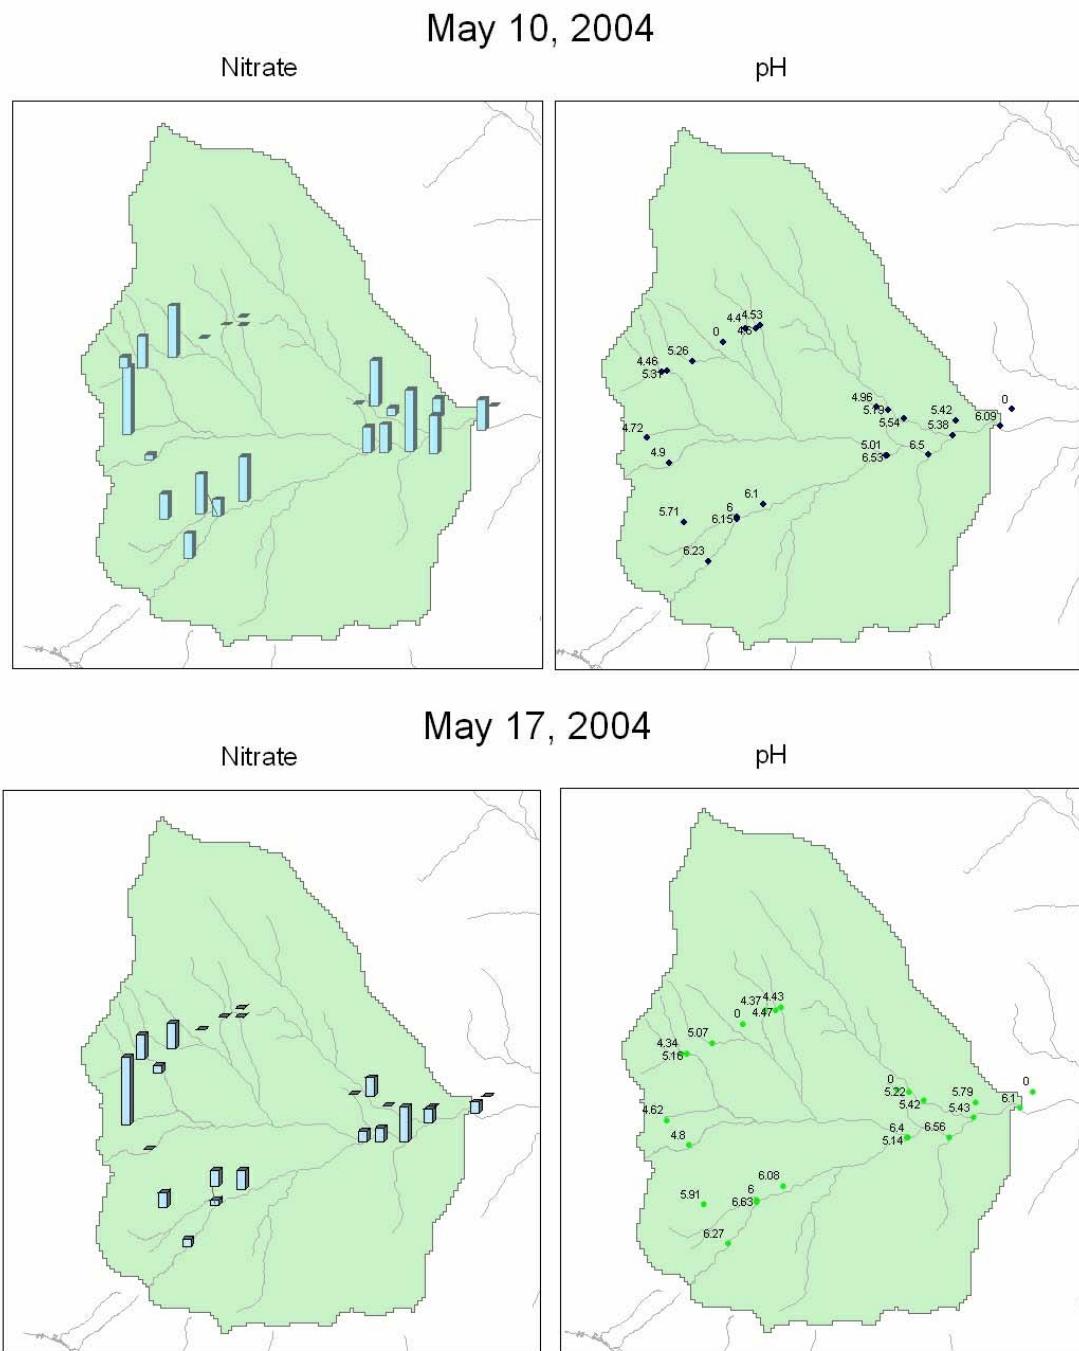

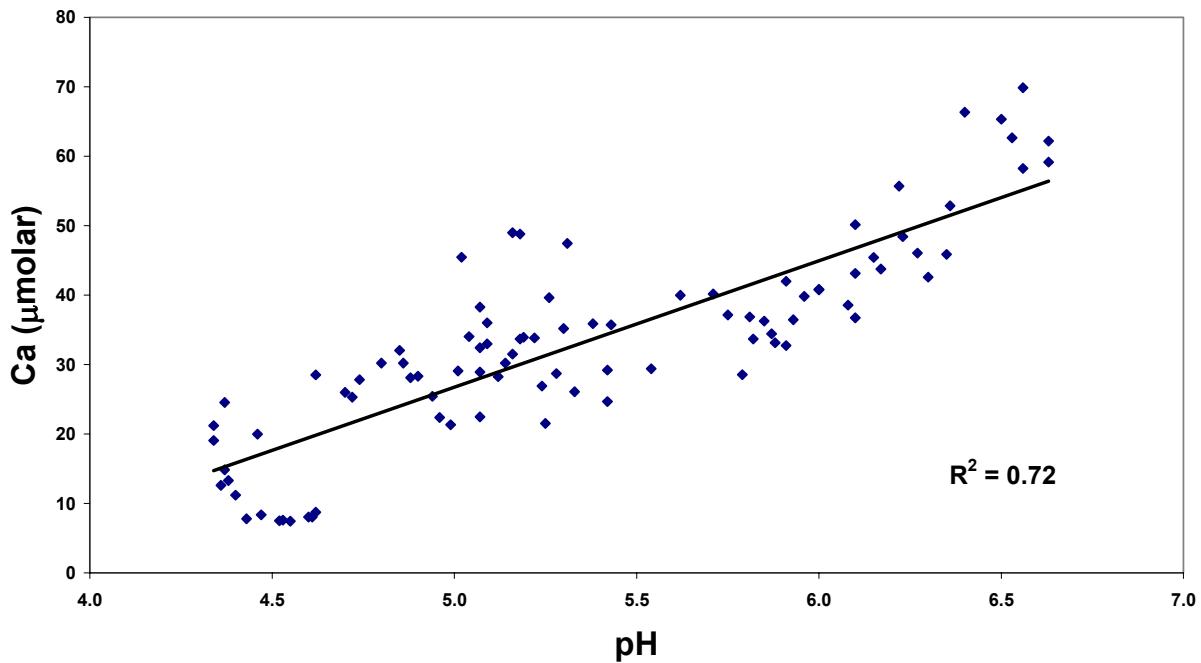

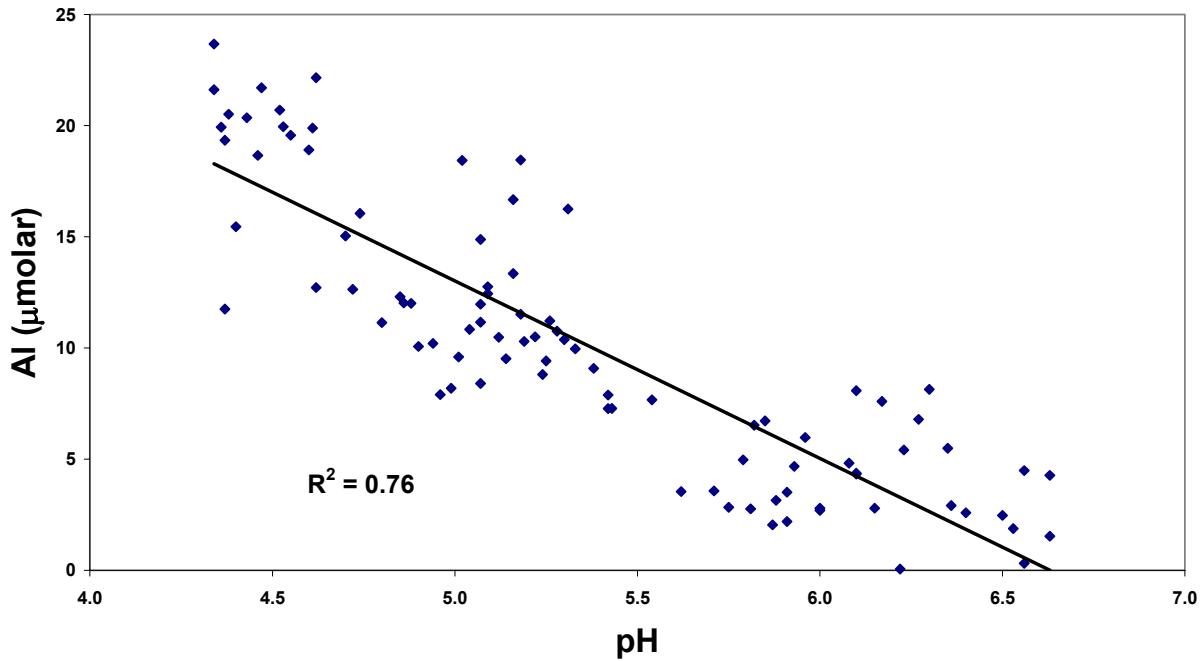

Figure 1b. Map of Ranch Brook watershed showing pH and nitrate results for two of the sampling dates.

Al and Si were run on unfiltered samples via ICP.

Detection limits were 0.01 mg/L for Al, Ca, Fe, Mg and Mn; 0.05 mg/L for Na, K and Si; and 2 μmol/L for the anions.

Table 3. Ranch Brook Stream Survey, May-July 2004.
