Building random networks: Stubs

Phase 1:

- ▶ **Idea:** start with a soup of unconnected nodes with **stubs** (half-edges):

- ▶ Randomly select stubs (not nodes!) and connect them.
- ▶ Must have an even number of stubs.
- ▶ Initially allow **self-** and **repeat** connections.

Building random networks: First rewiring

Phase 2:

- ▶ Now find any (A) self-loops and (B) repeat edges and **randomly rewire** them.

- ▶ **Being careful:** we can't change the degree of any node, so we can't simply move links around.
- ▶ **Simplest solution:** randomly rewire **two edges** at a time.

General random rewiring algorithm

- ▶ Randomly choose **two edges**. (Or choose problem edge and a random edge)

- ▶ Check to make sure edges are **disjoint**.

- ▶ Rewire one end of each edge.
- ▶ Node degrees **do not change**.
- ▶ Works if e_1 is a self-loop or repeated edge.
- ▶ Same as finding on/off/on/off 4-cycles. and rotating them.

Phase 2:

- ▶ Use rewiring algorithm to remove all self and repeat loops.

Phase 3:

- ▶ **Randomize network** wiring by applying rewiring algorithm liberally.
- ▶ **Rule of thumb:** # Rewirings $\simeq 10 \times$ # edges^[10].

People thinking about people:

How are social networks structured?

- ▶ How do we define and measure connections?
- ▶ Methods/issues of self-report and remote sensing.

What about the dynamics of social networks?

- ▶ How do social networks/movements begin & evolve?
- ▶ How does collective problem solving work?
- ▶ How does information move through social networks?
- ▶ Which rules give the best 'game of society'?

Sociotechnical phenomena and algorithms:

- ▶ What can people and computers do together? (google)
- ▶ Use **Play + Crunch** to solve problems. Which problems?

Two features characterize a social 'Small World':

1. Short paths exist, (= Geometric piece)
and
2. People are good at finding them. (= Algorithmic piece)

Milgram's small world experiment with email:

The screenshot shows a web interface for the 'my small world' project. It features a central network diagram with circular nodes representing individuals and lines representing connections. The nodes are arranged in a roughly circular pattern, with some nodes being larger and more prominent than others. The interface includes a navigation menu on the left with sections for 'Events and News', 'Project Information', 'Research Team', and 'Web Development'. A central text area provides instructions for the experiment, such as 'Your objective is to get a message to a "target person", somewhere in the world, by forwarding the message to a friend of yours—someone who is "closer" to the target than you are.' and 'If you are just visiting us, sign up to start a new chain.' The bottom of the page features the Columbia University logo and the text 'COLUMBIA UNIVERSITY'.

William (New York, NY) is studying medicine with

The **SMALL WORLD** project is an online experiment to test the idea that any two people in the world can be connected via "six degrees of separation".

Your objective is to get a message to a "target person", somewhere in the world, by forwarding the message to a friend of yours—someone who is "closer" to the target than you are. (If you happen know the target, you can of course send it to them)

If we have asked you to participate (you would have received a message from a friend of yours), you should continue the chain.

If you are just visiting us, sign up to start a new chain.

P. S. Dodds, R. Muhamad, and D. J. Watts,
Science, Vol. 301, pp. 827–829, 2003. ^[6]

Social search—the Columbia experiment

- ▶ 60,000+ participants in 166 countries
- ▶ 18 targets in 13 countries including
 - ▶ a professor at an Ivy League university,
 - ▶ an archival inspector in Estonia,
 - ▶ a technology consultant in India,
 - ▶ a policeman in Australia,
and
 - ▶ a veterinarian in the Norwegian army.
- ▶ 24,000+ chains

We were lucky and contagious (more later):

Nevertheless, some weak discrepancies do exist...

Contrived hypothetical above average connector:

Norwegian, secular male, aged 30-39, earning over \$100K, with graduate level education working in mass media or science, who uses relatively weak ties to people they met in college or at work.

Contrived hypothetical below average connector:

Italian, Islamic or Christian female earning less than \$2K, with elementary school education and retired, who uses strong ties to family members.

Finding balloons:

Clever scheme:

- ▶ Max payout = \$4000 per balloon.
- ▶ Individuals have clear incentives to both
 1. **involve/source more people** (spread), and
 2. **find balloons** (goal action).
- ▶ Gameable?
- ▶ Limit to how much money a set of bad actors can extract.

Extra notes:

- ▶ MIT's brand helped greatly.
- ▶ MIT group first heard about the competition a few days before. **Ouch.**
- ▶ A number of other teams did well (田).
- ▶ Worthwhile looking at these competing strategies. [11]

The social world appears to be small... why?

Theory: how do we understand the small world property?

- ▶ Connected **random networks** have short average path lengths:

$$\langle d_{AB} \rangle \sim \log(N)$$

N = population size,

d_{AB} = distance between nodes A and B .

- ▶ **But: social networks aren't random...**

Small-world networks

Introduced by Watts and Strogatz (Nature, 1998) ^[15]
“Collective dynamics of ‘small-world’ networks.”

Small-world networks were found everywhere:

- ▶ neural network of *C. elegans*,
- ▶ semantic networks of languages,
- ▶ actor collaboration graph,
- ▶ food webs,
- ▶ social networks of comic book characters,...

Very weak requirements:

- ▶ local regularity + random short cuts

But are these short cuts findable?

Nope. [8]

Nodes **cannot** find each other quickly
with **any local search method**.

Need a more sophisticated model...

Previous work—finding short paths

- ▶ What can a local search method reasonably use?
- ▶ How to find things without a map?
- ▶ Need some measure of distance between friends and the target.

Some possible knowledge:

- ▶ Target's identity
- ▶ Friends' popularity
- ▶ Friends' identities
- ▶ Where message has been

Jon Kleinberg (Nature, 2000) [8]
“Navigation in a small world.”

Allowed to vary:

1. local search algorithm
and
2. network structure.

Previous work—finding short paths

Kleinberg's Network:

1. Start with regular d -dimensional cubic lattice.
2. Add local links so nodes know all nodes within a distance q .
3. Add m short cuts per node.
4. Connect i to j with probability

$$p_{ij} \propto x_{ij}^{-\alpha}.$$

- ▶ $\alpha = 0$: random connections.
- ▶ α large: reinforce local connections.
- ▶ $\alpha = d$: connections grow logarithmically in space.

Previous work—finding short paths

Main story

Theoretical optimal search:

- ▶ “Greedy” algorithm.
- ▶ Number of connections grow logarithmically (slowly) in space: $\alpha = d$.
- ▶ Social golf.

Search time grows slowly with system size (like $\log^2 N$).

But: social networks aren't lattices plus links.

Previous work—finding short paths

- ▶ If networks have hubs can also search well: Adamic et al. (2001) ^[1]

$$P(k_i) \propto k_i^{-\gamma}$$

where k = degree of node i (number of friends).

- ▶ Basic idea: get to hubs first (airline networks).
- ▶ **But: hubs in social networks are limited.**

If there are no hubs and no underlying lattice, how can search be efficient?

Which friend of **a** is closest to the target **b**?

What does 'closest' mean?

What is 'social distance'?

One approach: incorporate **identity**.

Identity is formed from attributes such as:

- ▶ Geographic location
- ▶ Type of employment
- ▶ Religious beliefs
- ▶ Recreational activities.

Groups are formed by people with at least one similar attribute.

Attributes \Leftrightarrow Contexts \Leftrightarrow Interactions \Leftrightarrow Networks.

Approximate analysis

- ▶ Deal with denominator: each added node brings m new edges.

$$\therefore \sum_{j=1}^{N(t)} k_j(t) = 2tm$$

- ▶ The node degree equation now simplifies:

$$\frac{d}{dt} k_{i,t} = m \frac{k_i(t)}{\sum_{j=1}^{N(t)} k_j(t)} = m \frac{k_i(t)}{2mt} = \frac{1}{2t} k_i(t)$$

- ▶ Rearrange and solve:

$$\frac{dk_i(t)}{k_i(t)} = \frac{dt}{2t} \Rightarrow \boxed{k_i(t) = c_i t^{1/2}.}$$

- ▶ Next find $c_i \dots$

Universality?

- ▶ For $A_k = k$ we had

$$n_k = \frac{1}{2} [(k-1)n_{k-1} - kn_k] + \delta_{k1}$$

- ▶ This now becomes

$$n_k = \frac{1}{\mu} [A_{k-1}n_{k-1} - A_k n_k] + \delta_{k1}$$

$$\Rightarrow (A_k + \mu)n_k = A_{k-1}n_{k-1} + \mu\delta_{k1}$$

- ▶ Again two cases:

$$k = 1 : n_1 = \frac{\mu}{\mu + A_1}; \quad k > 1 : n_k = n_{k-1} \frac{A_{k-1}}{\mu + A_k}.$$

- ▶ Time for pure excitement: Find **asymptotic behavior** of n_k given $A_k \rightarrow k$ as $k \rightarrow \infty$.
- ▶ Insert question from assignment 7 (田)
For large k , we find:

$$n_k = \frac{\mu}{A_k} \prod_{j=1}^k \frac{1}{1 + \frac{\mu}{A_j}} \propto k^{-\mu-1}$$

- ▶ Since μ depends on A_k , **details matter...**

Universality?

- ▶ Now we need to find μ .
- ▶ Our assumption again: $A = \mu t = \sum_{k=1}^{\infty} N_k(t) A_k$
- ▶ Since $N_k = n_k t$, we have the simplification
$$\mu = \sum_{k=1}^{\infty} n_k A_k$$
- ▶ Now substitute in our expression for n_k :

$$1\mu = \sum_{k=1}^{\infty} \frac{\mu}{A_k} \prod_{j=1}^k \frac{1}{1 + \frac{\mu}{A_j}}$$

- ▶ Closed form expression for μ .
- ▶ We can solve for μ in some cases.
- ▶ Our assumption that $A = \mu t$ looks to be not too horrible.

Superlinear attachment kernels

- ▶ Rich-get-much-richer:

$$A_k \sim k^\nu \text{ with } \nu > 1.$$

- ▶ Now a **winner-take-all** mechanism.
- ▶ One single node ends up being connected to almost all other nodes.
- ▶ For $\nu > 2$, all but a finite # of nodes connect to one node.

Overview Key Points for Models of Networks:

- ▶ Obvious connections with the vast extant field of graph theory.
- ▶ But focus on dynamics is more of a physics/stat-mech/comp-sci flavor.
- ▶ Two main areas of focus:
 1. **Description:** Characterizing very large networks
 2. **Explanation:** Micro story \Rightarrow Macro features
- ▶ Some essential structural aspects are understood: degree distribution, clustering, assortativity, group structure, overall structure,...
- ▶ Still much work to be done, especially with respect to dynamics... **#excitement**
