

2009 University of Vermont Combined Research and Extension Annual Report of Accomplishments and Results

Status: Accepted

Date Accepted: 05/28/2010

I. Report Overview

1. Executive Summary

UVM Extension and VT-AES continue to effectively collaborate at all levels to improve the quality of life for all Vermonters. With a global economic downturn affecting all sectors of VT's economies, the work of UVM Extension and VT-AES, targeting VT's underserved, has become more crucial while requiring ever greater efficiencies. During FY09, UVM Extension and VT-AES together applied USDA's \$3.5 million to leverage an additional \$14 million in grants, contracts and fees, and \$7 million from state sources to address community needs. UVM also hired specialists to address VT's critical issues, outlined below. Faculty established 10 new patents in FY09, including 4 products to greatly boost maple syrup production, disease-resistance-associated enzymes and genetic expression vectors, a safe, greener whey-protein based wood adhesive. Hatch funds supported 288 projects during FY09. Of these, 15 were integrated projects.

Regional and Local Safe Food Systems Development

UVM recognizes that severe problems exist in our nation under current food systems, including that:

- 67% of U.S. adults age 20 and above are overweight, 34% are obese (CDC, 2008);
- 17 million U.S. household have difficulty obtaining enough food during the year (ERS, 2009); and
- food-borne illnesses affect tens of millions of Americans each year (CDC, 2005).

Increased efforts, through large multistate and federal grants and FTE shifts, helped UVM to focus on creating efficient, safe, and responsive local and regional food and product-based economies and opportunities. VT-AES and UVM Extension faculty are developing useful measures of regional agricultural self-sustainability through local markets. One method quantifies aggregate maximum food needs met, and another method provides commodity-based maxima. Social network analysis is making sense of complex, decentralized organizational communication networks, helping to discern useful and used information sources and correlates to successful communication networks. UVM is investigating transportation networks to improve safe food distribution and farm safety in case of disease outbreaks or terrorist events. Studies have helped local food promoters to understand VT's current limits in meeting food needs, and where gaps are greatest.

Utilizing Technology to Improve Business Opportunities for VT

UVM successfully patented on-farm by-products, including whey, a major waste product for cheese farmers across the state. UVM researchers are recycling this by-product into wood stains and glues absent volatile chemicals harmful to humans and the environment. The creation of novel probiotic food and beverage are providing people with healthier food options and providing entrepreneurial opportunities for VT farmers and probiotics food distributors. Use of internet communications options has improved opportunities for developing higher profit margin farming operations, such as organic apple and cold-hardy wine production. UVM has played a large role in the development of the national OrganicA eXtension website. The effort demonstrates the successful integration of 6 UVM Extension and VT-AES personnel.

Developing Cost-effective Greenhouse Gas Emissions and Water Quality Improvement Practices

New faculty is working to reduce methane gas emissions produced by on-farm animals. Studies show how changing dairy feed components and pasture practices reduce on-farm methane production and emissions. Research also focuses on adding chemicals to feed and using other microbes to outcompete methane-producing microbes involved in animal digestion. Working internationally, models and *in situ* studies show how balancing farm food with biodiesel crops reduces costs, increases outputs, and reduces reliance on fossil fuels, thereby reducing greenhouse gas emissions. UVM work conducted in Europe has shown benefits to farmers that surpass European Union subsidy payments received.

Through collaborative local and regional partnerships, phosphorus runoff from more than 4,000 small (< 200 acres) dairy farm acres was reduced by eight percent within one year of UVM implementing new practices with 30 small farm operators. As part of the nutrient management plans implemented, soil testing led to changes in practices that reduced fertilizer use and feed costs, due to resulting increased crop yields. UVM received a three-year grant for "pioneering" work on field trials of innovative steel slag technology for treatment of silage leachate. This new technology could benefit the farming community with affordable (minimal energy, land and maintenance requirements) and efficient solutions for agricultural wastewater treatment. VT-AES research is restoring a more positive view of the role nematodes play as indicators of soil health and in regulating soil decomposition. Other UVM studies are providing examples and basic information confirming the need for balance with regard to nonnative earthworms in soils, which can actually harm soil health if not kept in check.

Helping VT Families Cope with Volatile Economy and Global Events Affecting Them

As many dairy and other farmers seek to diversify to seasonal crops, and as VT maple production is being negatively impacted by climate change, new sap spout patents by UVM are increasing sap yields by 50 to 100 percent per tree, and annual crop yields by 20 to 50%. The business complement to the sap spout development received 1.5 million advance orders and projected sales of three million units, making the spout its number one selling product. UVM continues to help dairy farms, still the predominant agricultural enterprise in VT, to develop more efficient whole-farm dairy production by addressing health and economic concerns on a number of fronts. UVM is developing new cost-saving mastitis treatments and development of mastitis resistant milking cows. Also, by addressing bedding improvements, farmers have saved money by reducing health costs and increasing milk production.

VT has suffered a high per-capita cost in terms of military personnel deployed overseas. 4H's Operation Military Kids (OMK) builds community connections for kids, empowers teens to share their stories, and helps them educate the community about the realities of the deployment cycle. Community members support kids with special Hero Packs that keep them in touch with deployed parents and babysitting. A mobile technology lab helps kids create cards, movies, emails, and digital art projects to send to parents serving away from home.

Multistate Initiatives

UVM has made national and international inroads through its multistate efforts in areas related to organic apple production, valuing on-farm biodiesel production, communicating efforts and outcomes within and between states, and profitably conserving forest and farmland. Cold-hardy winegrape production grants involve researchers from throughout the northeast and Quebec. UVM launched the OrganicA website in 2007, and ongoing stakeholder evaluations show that 100% found the organic information useful, with 56% of respondents stating that they have used the information on the website in decision-making; 81% believed that the website will enhance the adoption of organic apple production. UVM conducted cold-hardiness trials for groundcovers popularly used in New England, but for which conflicting data exists. A New England-wide survey of the horticulture industry resulted in data showing an industry value of \$4.7 billion, with over 11,900 firms employing an estimated 156,000 people. Data is being used by regional funders and the survey served as a model for a similar effort by the Association of Professional Landscape Designers.

UVM developed a New England raspberry Pest Management Strategy Plan for EPA and evaluated the maple industry for pest management practices in advance of developing a plan for maple producers.

UVM continues to work in the Middle East to develop integrated pest management strategies for Sunn Pest, a major cause of wheat and barley damage. Using novel procedures, entomopathogenic fungal isolate persistence has been verified 12 months post-application in several over-wintering sites in the Middle East. Use of this option for reducing Sunn Pest damage is resulting in lower pesticide use, higher wheat quality, reduced environmental impact and reduced health risks to farmers and consumers. UVM has been working with Rhode Island to develop healthier soil indicators and mechanisms for reducing inputs while increasing soil health.

Results of a multistate health project involving Vermont and Arkansas, built upon 14 years of weight loss research conducted by UVM, demonstrate the copyrighted VTRim program leads to weight loss after 6 months for a majority of participants, regardless of whether they participate using internet only (average loss 10 pounds), internet and in-person meetings (average loss 15 pounds), and in-person meetings only (average loss 21 pounds). The program is now being marketed throughout the nation.

Integrated Initiatives

A total of \$868,543 was expended by UVM Extension and VT-AES on integrated projects. These include projects that are:

- increasing sap yields for maple producers with vacuum technologies
- reducing phosphorus runoff into waterways through portable wastewater management technology;
- helping Vermonters to identify food-related behaviors associated with healthy weights, including how dinners are produced, the percent of time eating out, and the number of hours TV is watched and monitoring their weight and calorie intake using daily journals;
- conducting studies and sharing research results for organic apple production, cold-hardy winegrape production, horticultural production, and integrated pest management
- providing more Vermont towns with useful planning data and resources, decision-making tools and training
- providing artisanal cheesemakers with new certification programs, courses and events that help them gain skills in cheesemaking, safety, tasting and sensing, and promoting their products;
- developing new markets and value-added products for farmers throughout the state through research, on-farm testing, marketing links and connections with entrepreneurs, and patenting products; and
- analyzing local and regional food systems, food deserts and gaps in self-sustaining food systems for Vermont

UVM Centers of Excellence utilize citizen advisory boards to inform and guide research and outreach agenda

responsive to local, state, and national priorities:

Center for Sustainable Agriculture&mdashan interdisciplinary approach to integrating university and community expertise to promote regional food systems development and sustainable farming systems throughout Vermont and the region;

Center for Rural Studies&mdashconnecting information and technical expertise with communities, businesses and policymakers in researching rural issues and information dissemination;

Proctor Maple Research Center&mdashapplied research in the production of maple sap and syrup;

Vermont Institute of Artisanal Cheese - conducting research and providing workshops on artisanal and raw milk cheese production quality and safety

What's Next?

Faculty, staff and community members exemplify VT's spirit of resilience under adverse economic and globally turbulent conditions. Volunteers provided more than 30,000 hours to serve others. UVM continues to steer university research and outreach in useful directions. Through the development of Spires of Excellence, UVM is focusing resources on transdisciplinary research to explore multi-scale biological system dynamics, environmental change and adaptation, food systems, and public policies, integrating ecological economics concepts throughout this work. Novel efforts to describe and focus work in these ways will guide research and outreach efforts to provide timely assistance that meets the increasingly multi-layered and externally influenced needs of VT in our dynamic global environment.

Total Actual Amount of professional FTEs/SYs for this State

Year: 2009	Extension		Research	
	1862	1890	1862	1890
Plan	34.8	0.0	13.8	0.0
Actual	52.0	0.0	18.6	0.0

II. Merit Review Process

1. The Merit Review Process that was Employed for this year

- External University Panel
- Expert Peer Review

2. Brief Explanation

Vermont was reviewed by the external panel from Maine, New Hampshire and Massachusetts. The input was considered by administrative teams in both Extension and AES. A joint meeting was held between Extension and AES to discuss the review and how the points could be incorporated into future programming efforts.

III. Stakeholder Input

1. Actions taken to seek stakeholder input that encouraged their participation

- Use of media to announce public meetings and listening sessions
- Targeted invitation to traditional stakeholder individuals
- Targeted invitation to selected individuals from general public
- Survey of the general public

Brief explanation.

UVM Extension has a state advisory board with representatives from across the state. The members of this board were drawn from a cross section of disciplines and program areas in which the organization provides educational opportunities. The members of the board have the responsibility to work with the director to review programs, budget decisions and new initiatives within the organization. The board includes at least one youth member, currently the Vermont Agricultural Ambassador for the State of Vermont that is selected annually. The members represent UVM Extension and not the individual disciplines or program areas from which they were selected for board discussions.

The board members are given weekly updates on the actions of the director and are encouraged to provide feedback to the director on an on-going basis. In addition, the board members are contacted on an as needed basis, collectively or individually to help provide feedback to the director. The board has two regularly scheduled business meetings per year and participates in the annual legislative reception.

In addition to the state advisory board, regional and local focus groups, surveys, discussions with associations, agencies and non-governmental organizations by the director, associate directors, faculty and/or program staff are all used to gather information from clientele regarding programmatic needs. The Center for Rural Studies conducts an annual Vermonter Poll, a phone survey of 600 Vermonters. Faculty and staff work with many partners and program participants who offer input on present and future programming to address identified needs.

2(A). A brief statement of the process that was used by the recipient institution to identify individuals and groups stakeholders and to collect input from them

1. Method to identify individuals and groups

- Use Advisory Committees
- Use Internal Focus Groups
- Use External Focus Groups
- Needs Assessments
- Use Surveys

Brief explanation.

UVM Extension and VT-AES have a state advisory board with representatives from across the state. The members of this board are drawn from a cross section of disciplines and program areas in which the organization provides educational opportunities.

Faculty and program staff gather input from participants and partners in program efforts to identify programmatic needs and development steps.

2(B). A brief statement of the process that was used by the recipient institution to identify individuals and groups who are stakeholders and to collect input from them

1. Methods for collecting Stakeholder Input

- Meeting with traditional Stakeholder groups
- Survey of traditional Stakeholder groups
- Meeting with traditional Stakeholder individuals
- Survey of traditional Stakeholder individuals
- Survey of the general public
- Meeting specifically with non-traditional groups
- Survey specifically with non-traditional groups
- Meeting specifically with non-traditional individuals
- Survey specifically with non-traditional individuals
- Meeting with invited selected individuals from the general public
- Survey of selected individuals from the general public

Brief explanation.

Stakeholder input is gathered with a variety of surveys and evaluation tools (on-line, both pre and exit surveys), input from technical and advisory boards, the Vermonter Poll and the Extension web based reporting system. Feedback from program participants and collaborators are taken into consideration when program revisions are made. As extension staff report work efforts, they include any stakeholder input gathered during that effort.

3. A statement of how the input will be considered

- In the Budget Process
- To Identify Emerging Issues
- Redirect Extension Programs
- Redirect Research Programs
- In the Staff Hiring Process
- In the Action Plans
- To Set Priorities

Brief explanation.

Nearly all program efforts ask participants about process and meeting their need for information and skills. That input directly influences current and future research and program efforts. Needs assessments were done for Dining with Diabetes and Community Leadership. The Vermonter Poll data was conducted and collected data from over 600 Vermont citizens.

Brief Explanation of what you learned from your Stakeholders

- Participants who are happy with their current program are anxious to give feedback that can be used to further meet their needs.

- During troubling economic times alternative delivery methods are being explored. Dining with diabetes needs assessment showed that an audience that was not being served was the caregivers and providers of those with diabetes. A pilot was done targeting that audience and was successful. In an effort to reduce delivery costs of the program, the program was developed and delivered via Interactive TV. This was rated equally by participants to traditional workshop settings.

- The Vermonter Poll showed that Promoting Renewable Energy was rated 10, highest on the scale of 1-10 by 46.9% of the Poll respondents. Higher than Water Quality in lake and streams (37.6%) and Thriving in Tough Economic Times (38%).

IV. Expenditure Summary

1. Total Actual Formula dollars Allocated (prepopulated from C-REEMS)			
Extension		Research	
Smith-Lever 3b & 3c	1890 Extension	Hatch	Evans-Allen

2. Brief description of the target audience

4-H: Adult Volunteers
4-H: Youth
4-H: Youth Volunteers
Adults
Age 13 - 18 Youth
Age 19 - 24 Young Adult
Age 25 - 60 Adult
Age 46 - 65 Adult
Age 6 - 12 School Age
Age 8 - 18 Youth
Agriculture/Natural Resources: Watershed Based Organizations
Agriculture: Apple Growers
Agriculture: CCA & Crop Consultants
Agriculture: Crop Producers
Agriculture: Dairy Producers
Agriculture: Equine Producers/Owners
Agriculture: Farm Employees
Agriculture: Farm Families
Agriculture: Farm Managers
Agriculture: Farmers
Agriculture: Goat & Sheep Producers
Agriculture: Greenhouse Ornamental Growers
Agriculture: Home Gardeners
Agriculture: Industry Professionals
Agriculture: Livestock producers
Agriculture: Maple Industry
Agriculture: Maple Sugar Producers
Agriculture: Nursery operators

V(E). Planned Program (Outputs)

1. Standard output measures

2009	Direct Contacts Adults	Indirect Contacts Adults	Direct Contacts Youth	Indirect Contacts Youth
Plan	65000	0	3000	0
Actual	48900	398000	2500	0

2. Number of Patent Applications Submitted (Standard Research Output)

Patent Applications Submitted

Year: 2009

Plan: 3

Actual: 10

Patents listed

Maple Check valve with antimicrobial
 Maple spray defoamer
 Booster spout (revised)
 Dual spout
 2-cistron expression vector for protein over-expression
 Guanyltransferase for 5'terminal base addition
 Whey protein based environmentally friendly wood adhesive
 Microfactory enhanced endophytic activity of biological control fungi
 MorC
 Validation of Glycolytic enzymes as drug targets for Cryptosporidium

3. Publications (Standard General Output Measure)

V(G). State Defined Outcomes**V. State Defined Outcomes Table of Content**

O. No.	OUTCOME NAME
1	extension employees will know what is expected from them in a disaster
2	Increase the number of farmers who will make a change by: growing oil seed crops, using local on-farm vegetable oil or biodiesel, and/or planning an individual or cooperative on-farm vegetable oil or biodiesel facility.
3	Increase in number of dairy farmers who adopt best management practices to improve their weak areas of the farming operation
4	Increase in number of farms completing Dairy Stewardship assessment who adopt at least two sustainable practices
5	Increase in number of maple producers who adopt recommended practices that increase overall system efficiency and syrup quality
6	Increase in number of sheep producers who report a reduced parasite load in animals
7	Increase in number of sheep farms who report decreased lamb mortality
8	Increase in the number of vegetable and berry growers implement changes in production, pest control, and/or management practice resulting in the desired outcome
9	Increase the number of growers implementing IPM practices reducing reliance on pesticides
10	Increase the number of commercial applicators implementing IPM practices
11	Increase the number of farm and forest landowners who implement their estate plan and/or transfer plan
12	Increase the number of farmers who implement at least one cropping practice to improve productivity, forage quality and profitability
13	Increase the number of maple producers adopting a recommended practice increasing their sap yields by 5%
14	Increase the number of maple producers making use of research findings to better estimate best tapping date
15	Increase the number of participants passing the required applicators licensing test
16	Increase the number of maple producers adopting most effective sap collection techniques
17	Increase the number of forest owners who plan for woodlands in their estates
18	Participants will begin growing organic grains as a part of their farming operation

19	Acres of forest land will be opened for tourism and recreation access
20	equine facilities incorporate biosecurity, safety and preventative measures
21	Increase in collaboration with agency and industry personnel to address farm safety
22	Increase in number of Growing Places graduates who make an intentional, informed decision not to start a business after completing the course
23	Increase in number of Growing Places graduates who go on to start a business within 18 months of course completion
24	Increase in number of fair, field days or event attendees who demonstrate an increased understanding of the health risks associated with the failure to wash hands by using safeguards provided (such as hand sanitation stations)
25	Increase in number of farmers who create and implement business plans
26	Increase in number of program participants who make informed decisions about crop insurance
27	Increase in number of tax school participants stating improved accuracy of tax reporting for their clients
28	Increase in number of tax schools participants understanding federal and state tax laws and requirements
29	Increase in number of farmers who use financial reports with another person for business purposes
30	Increase in number of farmers who implement a practice that improves soil quality resulting in improved crop yield and quality
31	Increase the number of businesses who report increases in profitability directly related to tourism
32	Increase in number of farmers that develop a nutrient management plan for their farm
33	Increase the number of farmers who implement at least one change in nutrient management plan practices
34	Increase the number of farmers who implement grazing plans
35	Increase the number of legislators and key decision makers who increase understanding of current local agricultural issues
36	Increase the number of school facilities that implement IPM strategies
37	Increase the number of sheep producers who supply lamb to Vermont Quality Meats
38	Decrease in number of days of beach closures in pilot areas.

39	Increase the number of farmers who will make a change by learning how to: grow oil seed crops, harvest oil seed crops, process oil seed crops into oil, produce biofuel, and plan a cooperative on-farm biofuel facility
40	Increase the number of growers who report cost savings from more cost effective and less toxic pest control due to easy access to pest control information sites.
41	Increase in the number of Watershed Alliance (WSA) interns who report increased knowledge and skills related to environmental education and watersheds.
42	Increase in number of farms that implement business plans resulting in increased profitability.
43	Increase number of gardeners and growers who select and grow new crops based on relevant information on climate tolerance, performance and overwintering of perennials
44	Increase number of towns using stormwater management and non-point source pollution prevention best management practices.
45	Increase the number of growers implementing Integrated Pest Management (IPM) practices reducing reliance on pesticides.
46	Increase the number of participants (who average 8 hours each in seminars) who will change a business practice(s)
47	Increased delivery of organic dairy information to dairy farmers across the nation that is accessible, reliable, credible and up-to-date.
48	Increase the number of local retail lawn and garden centers that are sources of information about low input lawn care options
49	Increase in number of Master Gardener participants earning certification
50	Increase in number of community watershed organizations developing pollution prevention outreach effort
51	Increase in number of educators in Watershed Alliance Program increasing knowledge and use of new teaching tools and techniques
52	Increase in number of households adopting low input lawn/garden care practices
53	Increase in number of participants who report making a change in on-farm production, marketing, financial management, legal or human resource aspects of their business
54	Increase in number of schools that continue to participate in Watershed Alliance (WSA) Program in subsequent years
55	Increase in number of students demonstrating increased knowledge of watersheds
56	Increase in number of towns adopting residential domestic NPS surveys to develop pollution prevention education
57	Increase in the number of farmers who improve pasture management practices
58	Increase in the number of student led community service watershed/water quality outreach projects

59	Increase or maintain the number of growers who make informed decisions regarding best integrated pest management (IPM) options to reduce economic, health and/or environmental risks
60	Increase the number of commercial properties reducing landscape inputs
61	Increase the number of home gardeners who increase their knowledge of Integrated Pest Management (IPM) practices
62	Increase the number of people who show improvement in food safety and preservation practices
63	Increase the number of student interns teaching backyard composting
64	Increase in number of Vermont Dairy Herd Improvement Association members that use their records to make herd management decisions that will improve business profitability
65	Increase in number of equine owners who use information to change behaviors in land and manure management of business practices to improve safety, animal health, and/or profitability of equine businesses and clientele
66	Increase in number of farmers who implement a practice that improves pasture health and soil quality for improved forage yields and quality
67	Increase number of 4-H dairy youth project members and 4-H dairy adult leaders who use the Vermont 4-H Dairy Project Manual
68	Increase number of dairy producers that make a facility change(s) to improve either herd health, herd productivity, the environment, community relations, labor efficiency, and/or crop quality/quantity
69	Increase the number of agricultural service providers who will make at least one change to their program and/or the way they work with beginning farmers to address stakeholder needs
70	Increase the number of farmers who implement cover cropping on their farm
71	Increase in number of forest owners, managers and users who make better decisions about forests using stumpage data
72	Increase in the number of forest owners saving money through use of written contracts for timber sales
73	number of farms that understand the consequences of a highly contagious disease outbreak
74	Number of enterprises (already using recommended practices) that use Extension consultation to assess/inform business decisions
75	farmers who implement at least one cropping practice to improve crop and soil productivity, water quality and profitability
76	Number of enterprises that adopt a recommended practice resulting in increased revenues and/or reduced costs
77	Number of farms that plan for and incorporate biosecurity, safety and preventative measures
78	Number of farms that understand the consequences of a highly contagious disease outbreak.

Issue (Who cares and Why)

Maple production is an enterprise in which thousands of Vermont landowners help preserve the forest landscape from development, and at the same time inject tens of millions of dollars into the state economy through direct sales and employment. Maple production also contributes to the image of Vermont as a leader in agriculture and environmental quality. To have a profitable and sustainable operation, maple producers must be educated with the latest information.

What has been done

The Vermont Maple Conferences are annual - day-long educational programs for maple producers organized by specialists from UVM Extension. Since their inception 6 years ago, total attendance has been just under three thousand producers. One of the major emphases of the conferences has been how to make syrup that meets the high quality standards for Vermont maple. Programming has consisted of classes on keeping lead out of maple products, finishing syrup by correctly using electronic instrumentation, proper packaging and storage, recognizing the cause of off-flavors, and appropriate boiling techniques.

Results

Following is a statement from Henry Marckres, chief of consumer protection with the VT Agency of Ag., and chief maple inspector: "The involvement of UVM Extension has made a significant impact in two specific areas of maple... lead content of maple syrup and inspecting and grading maple syrup for quality. Early testing (2000) for lead showed an average of over 300 ppb in Vermont samples... During our last testing (2008) of 100 producers, the average test was below 100 ppb... huge difference in the safety and quality of maple syrup ...significant drop in violations found in retail maple syrup... About 2,000 inspections are performed annually... seen a drop in violations from 150 in 2000, to just 15 in 2008. The education provided to producers has made a great impact on what consumers are buying at retail outlets."

3c. Qualitative Outcome or Impact Statement**Issue (Who cares and Why)**

It is important to Vermonters to maintain a viable agricultural industry. The success of the livestock producers will help insure that. With the recent interest in locally grown food, an opportunity exists for Vermont sheep and other livestock farmers. It is important that producers raise healthy, high quality animals to meet consumer's expectations. However, treating all animals can be an expensive proposition and it also creates internal parasites that become resistant to the chemical used to control them.

What has been done

In 2007 and 2008 classes for sheep and goat producers were held demonstrating how to use the FAMACHA system of parasite control. This system was developed in South Africa and it allows producers to identify which animals and when they need to be treated. In 2009 a survey of those who had attended the classes in 2007 & 2008 was done.

Results

It was determined that 21 of the 22 people surveyed have adopted the FAMACHA system to control parasites. Sixteen or 80% of the people surveyed are deworming their animals less often than before using the FAMACHA system. Five producers have saved between \$5 and \$40, five have saved between \$41 and \$80, and two producers have saved between \$80 and \$120. The cost savings encourages targeted deworming and improves the health of these herds.

A key value to Vermonters' is protecting the landscape that is 'Vermont' and its natural resources, especially water. Intensive land development, urbanization and agricultural production can result in erosion and stormwater runoff that degrades many Vermont streams and watersheds. The farming community has the complex job of keeping economically viable while protecting the environment. Best management practices that accomplish both do exist and are implemented on farms throughout Vermont.

What has been done

Since 2006 the Nutrient Management program has focused on erosion control through improved cover cropping strategies and guiding farmers in developing their own water quality assessments, and nutrient management plans (NMP). Through collaborative efforts there were on-farm research/demonstration sites, more than 24 farm tours and field days, 8 workshop series, 12 single session workshops, and over 1100 consultations. Another two-year project developed site-specific (NMP) for 30 Small Farm Operation (SFO) livestock farms.

Results

Results: *87 farmers have developed a NMP for their farm; 62 implemented at least one recommended practices from their NMP *32 farmers developed a NMP and adopted a recommended practice to reduce off-site movement of crop nutrients *62 farmers implemented at least one cropping practice to improve crop and soil productivity, water quality and profitability *41 farmers developed water quality protection plans; 15 farmers implemented at least one change as outlined in the water quality protection plan *As a result of cover cropping research and demonstration over 3000 acres of cover crops have been integrated. *The 30 SFO whose weighted average Total P Index score across 385 fields decreased from 54.6 in 2007 to 50.3 in 2008 (P = 0.03) reducing non-point source P loss by 8%, 1/2 the P reduction in the NMPs.

Home gardeners are looking for information on ways to garden more environmentally-friendly and sustainably, for new plants that are hardy and will survive, and for information about how to make them survive. Success will result in greater plant sales for growers (a \$119 million industry in Vermont) and continued gardening by home gardeners who are saving money and being environmentally-friendly with their gardening practices.

What has been done

The Flower Show is in its 12th year with an estimated total attendance of 75,000. In 2009 the Flower Show was held in collaboration with the VT Nursery and Landscape Assoc., attended by over 10,000. Dr. Perry, a UVM Extension faculty member served as organizer for the seminar series of 27 seminars over the 3 days, with 2 concurrent sessions daily. An evaluation of the 2009 Flower show attendees asked if they had attended the show in previous years, and if so had they made changes in 3 areas as a result of the information provided in previous years.

Results

In 2009 an estimated 440 unique home gardeners attended seminars, 51% averaging 2 seminars, 15% averaging 4 seminars, and 14% averaging attending 7 or more seminars. Seminars were rated 3.8 out of 4, 4 being excellent. Of those attending 85% had been to the show before. One attendee shared, "The seminars are the reason I come to the show. They make the ticket price an incredible value."

Evaluations showed that as a result of attending the show and talks in previous years,

- * 58% (255) had changed gardening practices,

* 66% (290) had begun to use more-environmentally friendly techniques and

* 68% (296) had grown new plants and varieties

Over the 12 years, an estimated 5000 unique gardeners have attended seminars. These gardeners will continue to garden beautifying their homes and communities, supporting an important industry to Vermont while feeling good about choices that save money, protect the environment through judicious use of herbicides, pesticides, and fertilizer, and using practices that limit erosion and water runoff.

Fire-sensitive plants may successfully invade pyrogenic landscapes, such as the piney woods of the southeastern US, if they can inhibit fire. Fire disturbance, both in terms of frequency and temperature, can influence the invasion of ecological communities by nonnative species. Non-native plants that modify existing fire regimes may initiate a positive feedback that can facilitate their continued invasion and put the existing native community at risk.

What has been done

Models of tree demography, and fire initiation and spread, were developed and run to investigate nonlinear transitions between alternate states using the invasive shrub, Brazilian pepper (*Schinus terebinthifolius*). Investigators explored the potential for nonlinear transitions from pine savannas to *Schinus* stands using individual-based simulation models enabling them to predict *Schinus* dispersal and demography, model dispersal and growth of *Schinus* into pine savannas burned at different frequencies, and predict effects on fire spread.

Results

Brazilian pepper can initiate a fire-suppression feedback in a fire-dependent pine savanna ecosystem in southeastern US. A computer model demonstrated that frequent fire may control low-density populations, but that Brazilian pepper may reach a sufficient density during fire-free periods to initiate a positive feedback that reduces the frequency of fire and converts the savanna to an invasive-dominated forest. Scientists found that prescribed burns caused significant (30-45%) mortality of Brazilian pepper at low densities and that savannas with more frequent fires contained less Brazilian pepper. However, high densities of Brazilian pepper reduced fire temperature by up to 200°C, and experienced as much as 80% lower mortality. The biology of an invasive species, with unique characteristics, may therefore overcome a native plant in environments where human interactions, such as fire suppression, occur.

Year	Quantitative Target	Actual
2009	175	200

3c. Qualitative Outcome or Impact Statement

Issue (Who cares and Why)

Gardeners are aware of the potential impacts of pesticides to their health and to the environment. They want to minimize their use of chemicals in the garden to protect their health, the health of their children and pets and the soil and groundwater.

What has been done

A portion of the 2 hour Master Gardener lecture on plant diseases is spent on pesticide use and pesticide safety and the incorporation of integrated pest management strategies to manage pests and diseases in the home garden and landscape. Basic pesticide labeling and warning statements are discussed with common pesticides used around the home garden used as examples.

Results

Home gardeners leave the lecture understanding what a pesticide is, what the risks are to the different pesticides and when to choose to use a pesticide or when to manage a disease or pest in other less toxic ways.

3c. Qualitative Outcome or Impact Statement

Issue (Who cares and Why)

Vermont farms and communities are vulnerable to a devastating bio-disaster. Maintaining the vibrant and diverse agriculture and food businesses in Vermont is important for food security and the economic vitality of the state. UVM Extension is positioned to help people involved in agriculture and food businesses, as well as their communities, better understand these vulnerabilities and prevent, prepare for, and prevail over any disasters they may face.

What has been done

UVM Extension with support from the NE Ctr for Risk Management Education and several local businesses conducted a Prepare to Survive a Bio-disaster workshop series in 3 locations around the state engaging dairy producers, allied industry personnel, and local emergency managers in understanding the problem and how all can work together to prevent or reduce the consequences of a highly contagious disease emergency. 87 individuals participated.

Results

Participants identified what information they would want to know when such an event struck and potential proactive response actions.

85% of participants reported a far greater understanding of the impact that a highly contagious disease emergency would have on their livelihood or community. As a result of this workshop series a Community Agro-emergency Planning (CAP) group was formed and continues.

One participant stated, "We all need to work together as one unit for the good of the ag community and the rest of the citizens of not only our towns but Vermont. We need to do it now."

3c. Qualitative Outcome or Impact Statement**Issue (Who cares and Why)**

Disruptions of transportation networks serving farms potentially affect food security, efficiency and profitability of farm businesses. The discovery of a highly contagious disease (e.g., foot and mouth) anywhere in the U.S. can severely impact dairy producers in VT. Producers and emergency crews must understand links between farms and associated levels of biosecurity risk. This project modeled agricultural transportation for a number of dairy farms, and identified critical links in transportation networks.

What has been done

Simulation modeling of contact networks and associated risks were collected to show the risk profile of a subset of dairy herds. 3 service personnel who travel farm to farm traced their routes. Data was used to model transportation networks of several dairy farms, including large conventional dairy, small conventional dairy, and organic dairy. Linkages included inputs (e.g., feed brought onto the farm) and outputs (e.g., raw milk to processor). Transportation outcomes and economic efficiencies were compared between baseline and 'disrupted' scenarios.

Results

The mapped contact networks clearly show that disease control zones of only six miles radius are inadequate to account for distances among farms sharing service personnel who have close contact with cattle. This information is supporting outreach and planning activities whereby the private sector, in coordination with state agencies, are developing plans to enable biosecure movement of milk and feed during a bio-disaster, such as foot-and-mouth disease. Such planning is vital to protect the 0.5 billion dollar livestock industry and 1.5 billion dollar tourism industry in Vermont.

Agricultural ecosystems produce food, fiber, and non-marketed ecosystem services (ES). Agriculture also typically involves high negative external costs associated with, for example, fossil fuel use.

What has been done

Researchers estimated, via fieldscale ecological monitoring and economic value-transfer methods, the market and non-market ES value of a combined food and energy (CFE) agro-ecosystem that simultaneously produces food, fodder, and bioenergy. Such novel CFE agro-ecosystems can provide a significantly increased net crop, energy, and on-marketed ecosystem services, compared with conventional agriculture, and require markedly less fossil-based inputs.

Results

Extrapolated to the European scale, the value of non-market ecosystem services from the combined food and energy agro-ecosystem exceeds current European farm subsidy payments. Such integrated food and bioenergy systems can thus provide environmental value for money for European Union farming and nonfarming communities. This same research can be applied to US farms to determine the value of combined food and energy farming.

V(D). Planned Program (Activity)

1. Brief description of the Activity

4-H Lifeskills Development Program: Help youth acquire Life Skills in the following areas: Decision Making; Critical Thinking; Problem-Solving; Communication; Goal-Setting; and Skills for Everyday Living to succeed as adults. **Delivery Methods:** 6-8 sequential learning hours using experiential learning techniques for in- school, afterschool, or out-of-school settings.

S.E.T. Activities: 4-H SET will begin to show how science and engineering issues affect youths' lives and prepare a future generation of scientists and engineers. The 4-H SET program will present 4-H with a new opportunity to connect to the LGU's SET research community and integrate with current youth workforce development initiatives.

COPE: Parent education for parents of minor children who have filed for separation, divorce, dissolving of a civil union, parentage, changes in rights and responsibilities concerning their children. This is a court mandated program.

Downtown Business District Analysis: This program provides the community with analytical techniques that can be put to work immediately in economic revitalization efforts. The process requires input from local residents so that recommendations reflect both market conditions as well as the preferences of the community. **Delivery Methods:** Group meetings and discussion groups in community.

Community Leadership: Assessing, addressing and expanding community capacity through leadership and public policy education efforts including building--and education members and clientele of--coalitions and collaborative.

EnviroQuest: Help youth acquire Life Skills in the following areas: Decision Making; Critical Thinking; Problem-Solving; Communication; Goal-Setting; and Skills for Everyday Living to succeed as adults. **Delivery Methods:** 6-8 sequential learning hours using experiential learning techniques for in-school, afterschool, or out-of-school settings.

Migrant Education Recruitment Program (MEP): To ensure that children of migrant farm workers, and qualifying youth under age 22, are aware of the educational support services available to them. **Delivery Methods:** Outreach to schools, agricultural employers, and social service agencies throughout the state.

Vermont AgrAbility Project: To make recommendations that can be used by farmers with disabilities to maintain employment, through development of accommodations. **Delivery Methods:** Process involves recruitment of eligible individuals through referrals. Intake information is recorded on farms provided by the National AgrAbility Project. Site visits are the primary means of contact.

Rural and Agricultural VocRehab Program: To assist individuals with disabilities living in rural areas and those in agricultural professions or self-employed by providing them with a variety of services tailored to their needs in order to maintain or obtain their selected employment outcome. **Delivery Methods:** Process involves recruitment of eligible individuals through referrals, assessment, writing up a plan of action, and providing services for eligible individuals. Printed materials and individual technical assistance are offered to strengthen the capacity of individuals to maintain or to prepare for meaningful work.

Take Charge (TC/RC): Helping community adult members to gain the skills necessary to be confident enough to take part in town government by ultimately competing for town government leadership positions. **Delivery Methods:** Meetings, discussion groups.

Town Government Project: Local town officers, decision makers and officials receive education and tools to improve job performance and management, addressing topics from new legislation to handling difficult customers. **Delivery methods:** Each one-day conference is held annually, at multiple sites.

Vermont Urban and Community Forestry program : A joint initiative between the University of Vermont Extension and the Department of Forests, Parks and Recreation. The mission of the program is to promote the stewardship of the urban and

rural landscapes to enhance the quality of life in Vermont communities. The program provides educational, technical and financial assistance in the management of trees and forests, in and around the built landscape. **Delivery Methods:** Classes, meetings, various media, community volunteer projects.

AES efforts:

- Community Development and planning
- On farm/community energy generation and secondary revenue generation
- Community and technology for rural community development
- Community market development and local foods distribution
- Communication methods and research studies for non-profit and profit organizations
- Agritourism
- Public land management
- Development of environmentally safe, non food product development (adhesives, plastics and road deicer) from whey
- Development of Artisan cheese markets
- Distinctiveness/marketing of regional foods

V(G). State Defined Outcomes**V. State Defined Outcomes Table of Content**

O. No.	OUTCOME NAME
1	85% of Certificate of Eligibility reviewed by the Dept. of Education will be 100% accurate and reflect eligible migrant students
2	Increase number of programs led or supported by trained volunteer Site Staff
3	Increase number of youth serving as Foundation trustees who indicate a positive experience
4	increase number of Take Charge/ReCharge participants are satisfied with the process used as a means meeting community planning needs
5	Increase number of communities establishing or expanding community tree program
6	increase in number of farm and rural residents with disabilities successfully served (ie case is closed) which is defined as having increased satisfaction with actual or potential employment and maintained or increased income
7	Increase number of 4-H club members who participate as pages in state level government, as a result of their 4-H experiences.
8	Increase in number of TOEC participants who report increased skills in leadership and decision making.
9	Increase number of 4-H staff self-reporting an increase in their ability to work with youth and adults to implement 4-H lifeskill development opportunities
10	Increase student enrollment in the Vermont Migrant Education Program
11	Increase the number of committee members implementing or enhancing broad-based decision-making skills
12	Increase the number of program participants serving as leaders on Committees
13	Increase the number of schools that offer financial literacy education
14	Increase the number of volunteers self reporting an increase in their ability to implement a 4-H lifeskill development for youth
15	Increase the number of youth who set and reach goals identified at the beginning of the 4-H year
16	Increase the number of clubs doing at least 6 hours of community service
17	Youth have greater opportunities to access and learn financial planning skills
18	increase in number of youth reached with lifeskills development programming self-report an increase in mastery for targeted life skill area: Decision making; critical thinking; problem solving; communication; goal setting or skills for everyday living.

19	Increase in number of youths involved in Urban Community Forestry
20	Increase number of clubs with SET related projects
21	Number of individuals (youth and volunteers) increasing knowledge and/or skills in content and careers (across subject areas ranging from animal science to environmental science to technology)
22	Increase the number of apprentices who achieve preset professional development goals within 3 years
23	Increase the number of apprentices who plan and implement a program evaluation.
24	Increase the number of apprentices who report the results of their program evaluation.
25	Number of individuals applying science process skills, including incorporation of science learning in community service, enrollment in SET-related post-secondary education, and/or entrepreneurship/career success
26	Number of individuals demonstrating improved behavior in science learning, such as effective participation in school classes, independent study, career exploration, or volunteer experiences
27	increase the number of participants who self report increase of skills in leadership and decision making.
28	increasing number of elected/appointed village, town or city officials that use information gained at TOEC in leadership and decision making
29	Number of SOUL participants who advocate for their communities public tree resource
30	number of Take Charge/ReCharge participants are satisfied with the process used as a means of meeting community planning needs
31	Number of participants report using skills learned in community setting

Many people with disabilities can and want to work. Not being able to live a productive life can be extremely debilitating. Many of these people would have to be supported by other programs if they were unable to regain or maintain employment. This is a huge savings to any economic barometer you would wish to look at, and it can give these folks the sense of personal accomplishment and pride. The Rural and Agricultural VocRehab Program (RAVR) and the VT AgrAbility Project are able to help these folks.

What has been done

For 40 years, the RAVR has been cooperatively funded and conducted through a unique arrangement of UVM Extension and the Vermont Division of VocRehab. Meetings with consumers are one-on-one at their homes and farms to discuss services, health conditions and impediments to successful employment. They explore worksite modifications and adaptations with immediate impact. They enable consumers to continue working in their established careers, or recognize transferable skills to seek other employment.

Results

The number of rural and farm individuals who have received services is estimated to be in excess of 3,000. The RAVR program works with over 200 clients, with approximately 75 completed rehabs annually. The VT AgrAbility Project has been successful in being awarded several National AgrAbility grants which continues to exceed their goal of 45 farmers a year, nearly doubling in year two. Following are two examples of cases closed: 1) \$2,500 for a year of farm labor to help maintain an established berry and vegetable farm while the owner operator underwent treatment for a brain tumor. This middle aged farmer has returned to his farm, and is selling produce to his regular customers. 2) \$1,950 to provide woodworking tools for a 42 year old man recovering from a stroke, now working as a carpenter.

3c. Qualitative Outcome or Impact Statement

Issue (Who cares and Why)

Education, English language skills, as well as other academic and basic life skills greatly impact one's ability to succeed in life. Migrant farm workers have the highest dropout rate of any minority group in the US school systems. Migrant workers are a vital workforce for Vermont farmers, meeting both seasonal and temporary workforce needs. Extension's Migrant Education Program (MEP) serves children and youth under the age of 22 with educational support services.

What has been done

With a multi-tiered statewide recruitment plan, UVM Extension MEP Recruitment staff locate eligible migrant families and individuals so they can receive the supplemental educational support and services the Vermont MEP offers. Every public school in VT is required to distribute our Agricultural Employment Survey to each new student and then return the form to UVM Extension MEP ID&R Team for review. Through frequent farm visits relationships are built with farmers and Migrant farm workers are located and if possible enrolled in the program.

Results

In 2009 alone, 400 farm visits and 250 school visits were done resulting in 453 students enrolled in the Vermont MEP giving the migrant youth and their family's access to educational support and services they likely would not have otherwise.

3c. Qualitative Outcome or Impact Statement

Issue (Who cares and Why)

The Tufts Study on Positive Youth Development has indicated that 4-H youth are more likely than participants in other youth development programs to have higher levels of giving back (citizenship) to communities and also higher aspirations of going on to college (goal setting). Every County in Vermont has 4-H programming occurring. Through these opportunities, youth gain a sense of belonging, sense of mastery, sense of independence, and an opportunity to help others (sense of generosity). (Kress and her references)

What has been done

Last year 10% of UVM 4-H club members age 12 and older completed a life skill assessment. Through a range of 4-H program offerings, including trainings for volunteers (191 volunteers self reported increased skills) who by donating almost 14,000 hours helped reach 6,286 youth in FY09.

Results

The evaluations concluded that 4-H youth made statistically significant gains in life skill development, particularly in the area of goal setting and problem solving.

* 81 clubs reported doing at least 6 hours of community service.

* 407 youth set and reached goals they identified at the beginning of the year, tracked through record books.

* 632 youth self reported mastery of at least one life skill

In a 4Her's words, "In 4-H I have learned how to be a leader and the importance of teamwork and self motivation. I have also found that reaching the goals that I set for myself makes me feel like I have accomplished something of value." Jared-age 18

Issue (Who cares and Why)

American Youth are losing ground in Science, Engineering and Technology (SET) compared to peers in other nations. Too many young Americans do not have the science, engineering and technology career skills necessary to succeed and meet our country's needs in the future. With 4-H and the Cooperative Extension System's direct connection to the research and resources of the nation's 106 land-grant universities and colleges, the 4-H SET program has become a 5-year national priority.

What has been done

56 4-H club programs reported doing SET related activities. There were 4 SET related school enrichment activities and 10 Special interest programs including programs on Embryology, GPS, Computer technology, Electricity, Engineering and Aerospace projects.

Results

In 2009, data collected through observation by leaders/teachers, showed that 2,192 students demonstrated improved behavior in science learning. Observers note such things as gains in decision making, scientific process, wise use of resources, leadership, observing, predicting, collecting data and inventing solutions. In one middle school, who has used the 4-H science curriculum and tools such as the "What Makes a Great Science Experience Checklist" for going on 3 years, has seen its NECAP math scores go from below state average at 61% to 11% above in 2008. One middle school teacher stated, "I know the science curriculum that Vermont 4-H has provided has added to our science and math successes."

3c. Qualitative Outcome or Impact Statement**Issue (Who cares and Why)**

Apples are an important component of New England's diversified agriculture. Although there is strong interest in organic apple production, there are very few certified organic orchards because of insect and horticultural challenges plus disease challenges associated with the predominant cultivar grown in the New England region (i.e., 'McIntosh'). There is a need to evaluate 'new' apple cultivars and research and integrate apple ecosystem dynamics into organic production systems to determine sustainability and profitability

What has been done

2 orchard systems that represent the way growers are changing to new apple cultivars were planted/top-grafted with five cultivars identified by growers as important to the future of the apple industry. The orchards received organic certification in 2008. Data was collected during "orchard establishment years" (first 3 years): During the third growing season, traditionally a time when growers allow some fruit to develop, fruit and the total kg yield per tree were recorded for each orchard. The economics of the two organic systems were compared by calculating the Net Present Value (NPV) of cash inflows and outflows.

Results

Yield in the top-grafted orchard (Orchard 2) was much greater than in Orchard 1 due to the larger tree size. Two key limiting factors were identified to tree health - organic nutrient management and ground cover management. Apple diseases were also a major concern. Results reinforce the importance of assessing the surrounding orchard ecosystem for disease sources. Abandoned, decayed apple trees near the two orchard systems were providing high levels of disease inoculum which impacted both disease management decisions and disease incidence in the orchards. A comprehensive organic apple extension program was launched with the OrganicA website which includes sections on horticulture, organic IPM, and case studies of organic apple growers. The website has received over 11,000 visits.

3c. Qualitative Outcome or Impact Statement**Issue (Who cares and Why)**

Poverty, hunger, and food insecurity are all factors that can contribute to poor health and poor nutrition. Often times it is the quality of food that is sacrificed in an effort to make ends meet. Research has shown the consumption of fruits and vegetables consumed by infants and toddlers typically decreases as they transition from their first foods into family meals.

What has been done

Partnering with the Vermont WIC Program parents with six month old babies were enrolled in this intervention over a six month time period in 2006, and then followed until the children reached their second birthdays. The Theory of Planned Behavior provided the theoretical framework. Trainings, targeted support materials, as well as S.M.A.R.T. goal setting were developed and implemented for WIC staff. A cohort design was used while keeping the fruit and vegetable message content similar, was used with program delivery to participants.

Results

An analysis of parent data (750 surveys) showed an overall increase in parental use of strategies to feed fruits and vegetables to their toddlers, and an intention to do even better in the future. 120 parents/caregivers have more positive feelings about feeding their toddlers than prior to the intervention. Although WIC families continued to experience barriers to increasing the amount of fruits and vegetables offered to toddlers, including cost, participating parents, as a group, significantly increased the number of servings of vegetables offered to their toddlers as part of a meal or snack. We conclude that there may be real benefits to providing nutrition counseling/education focused on one topic, in this case fruits and vegetables, for an extended time.

3c. Qualitative Outcome or Impact Statement

Issue (Who cares and Why)

Diabetes prevalence is increasing nationally and in Vermont. By comparing Behavioral Risk Factor Surveillance System (BRFSS) average data from 2006-2008 with data from 1999-2001 for Vermont adults over age 65, the total diagnosed diabetes prevalence has increased from 24.9 to 28.3 percent in this short time frame. As the population ages and experiences the effects from overweight and obesity, diabetes prevalence is expected to rise. Due to limited resources other modes of delivery to reach audiences are needed.

What has been done

As a pilot we offered our Dining with Diabetes program (DWD) over Vermont Interactive Television (VIT) and targeted caregivers of people with diabetes. We adapted program materials, produced food demonstration videos instead of cooking on site, and created various learning activities. Out of 121 participants at 11 VIT sites, approximately 87% of our attendees were caregivers, and 13% were people living with diabetes. Sixty participants completed both pre and post surveys distributed during the first and last class sessions.

Results

Responses show that the pilot done over VIT was considered quite favorably. Attending a course taught over VIT was rated equally to attending a face-to-face class. Of the 60 caregivers who completed the survey they indicated they planned meals for a total of 149 people, shopped for a total of 163, and prepared meals for a total of 189 people. 31 of the caregivers indicated on the post survey they had already changed behaviors using the information learned. One participant shared that after surgery he was self monitoring what he could eat, his doctor was impressed. When a dietary staff person asked if he didn't want carrot cake he told her "no, just bring me a piece of fresh fruit." In the future, we plan on using VIT and possibly other methods to deliver this important Diabetes education program.

3c. Qualitative Outcome or Impact Statement**Issue (Who cares and Why)**

Obesity is reaching epidemic levels. Hours spent watching TV likewise has risen. Investigators hypothesize a connection exists between TV viewing and obesity as a result of cessation of other activities, increased food consumption, and reduced resting metabolism. Previous studies have found weak, positive or no associations. This study examined the effects of reduced TV viewing on energy intake and expenditure in overweight or obese adults using principles from behavioral economics to determine the relationship.

What has been done

Adults were recruited for a 6-week randomized controlled trial. After a 3-week observation-only baseline phase, participants were stratified by BMI and randomized to an observation-only control group or an intervention group for 3 weeks. Based on viewing habits established during the observation period, each person in the intervention group was given a weekly limit of TV time. Once the limit was reached, a monitor automatically shut the TV off until the next week. The control group had no limits on TV viewing and continued to watch TV as before.

Results

The study found that watching less TV doesn't necessarily lead to more exercise or better eating habits, but it does result in subtle but meaningful changes in overall activity levels. The intervention group significantly increased energy expenditure compared with controls. Both groups reduced their EI for intervention and control group participants, although the difference was not statistically significant. The intervention group showed a greater reduction in BMI. There was no change in sleep. While the intervention group burned off an additional 120 calories a day compared with the previous three weeks, the control group became even more sedentary, moving about 100 calories less than before. The additional activity that resulted from less television time is the equivalent of walking about eight miles a week.

KA Code	Knowledge Area
703	Nutrition Education and Behavior

V(H). Planned Program (External Factors)

External factors which affected outcomes

- Economy
- Appropriations changes
- Public Policy changes
- Government Regulations
- Competing Public priorities
- Competing Programmatic Challenges

Brief Explanation

Poverty is the number one predictor of hunger and food insecurity. Recent data indicates that approximately 71,000 Vermonters (12% of the total population), of which approximately 19,000 are children live in poverty. An additional 109,000 (18% of the total population) have a gross annual income between 100-199% of the federal poverty level and are considered low-income. Lack of affordable housing, jobs, and transportation coupled with the rising costs of food and fuel may force many Vermont families to further sacrifice the quantity or quality of foods they eat in exchange for other necessities.

V(I). Planned Program (Evaluation Studies and Data Collection)

1. Evaluation Studies Planned

- After Only (post program)
- Retrospective (post program)
- Before-After (before and after program)

Evaluation Results

Interactive Television was piloted as a delivery method with caregivers and individuals with diabetes. Participants in the class completed both pre and post surveys distributed during the first and last class of the sessions. It was rated equally to a face to face class.

Consumption of fruits and vegetables by children in the Vermont WIC Program decreases as they transition from their first foods into family meals. University of Vermont Extension partnered with the Vermont WIC Program to address this problem. Parents with six month old babies in the Vermont WIC program were enrolled in this intervention over a six month time period in 2006, and then followed until the children reached their second birthdays. An analysis of parent data (750 surveys) showed an overall increase in parental use of strategies to feed fruits and vegetables to their toddlers, and an intention to do even better in the future. Although WIC families continued to experience barriers to increasing the amount of fruits and vegetables offered to toddlers, including cost, participating parents, as a group, significantly increased the number of servings of vegetables offered to their toddlers as part of a meal or snack

Key Items of Evaluation

Interactive Television (IT) is a valid delivery method even for a program typically taught with hands on cooking. Videos were used in IT in the place of actual on-site cooking. Participants rated it equally to face to face class. More participants were reached and more individuals were affected by the participation of caregivers as a new audience in the program.

3c. Qualitative Outcome or Impact Statement

Issue (Who cares and Why)

Lake Champlain is a critical economic factor for Vermont but stormwater from urban areas degrades Lake Champlain and many Vermont watersheds. Stormwater is a major source of non-point source (NPS) pollution. Because individual properties are sources of stormwater and NPS pollutants, successful control and reduction depends on the actions of thousands of property managers, from homeowners to municipal governments. Training and technical support by UVM Extension helps build aware and engaged urban communities that reduce NPS pollution at the source.

What has been done

UVM Extension is limited in its ability to work directly with large numbers of individual home owners statewide to reduce NPS pollution on a property by property basis. Instead, to increase effectiveness and efficiency, we worked with partner organizations, such as lake associations, watershed groups and businesses to provide the public awareness and education needed to change homeowner practices and reduce stormwater impairment. Influencing the leadership of these organizations to support these efforts was key to program success.

Results

A 2009 assessment of the Green Lawn Coalition lawn care retailer education program showed that a) quantities of non-farm phosphate fertilizer sold nearly halved, from 294.25 tons in 2003 to 161.2 tons in 2007; b) the number of phosphorous free lawn care products registered for sale in the state increased dramatically, from 80 in 2003 to 221 in 2008. Following a student-led outreach effort, over 60% (71/118) of lakeshore households at Lake St Catherine's, VT were aware of the link between lawn care practices and water quality and more than 25% (30/118) had adopted at least one pollution prevention practice leading to estimated annual load reductions of 45.4 tons sediment and 61 pounds of phosphorus/yr.

3c. Qualitative Outcome or Impact Statement

Issue (Who cares and Why)

Lake Champlain is a critical economic factor for Vermont but stormwater from urban areas degrades Lake Champlain and many Vermont watersheds. Urban stormwater is a major source of non-point source (NPS) pollution, primarily sediments, bacteria, toxic chemicals and phosphorous, that impairs our waterways. Because individual properties are the sources of stormwater and NPS pollutants, successful control and reduction depends on the actions of thousands of property managers, from homeowners to commercial lawn care providers to municipal governments.

What has been done

We identified the individuals responsible for making decisions on property management for commercial and municipal properties and targeted these individuals for NPS pollution prevention education efforts. We used multiple delivery methods, based on audience and desired outcomes, to inform these individuals about the social, environmental and financial benefits of low input property management for pollution prevention.

Results

Those adopting the recommended practices changed policy and regulations making significant gains in reducing NPS pollution in some communities.

*The largest employer in the state installed a rain garden to treat parking lot storm water; *Woodstock, VT added a LID ordinance to its zoning regulations; *Business property managers in 3 towns adopted low input practices; *In two towns low input practices are active on an estimated 50% of business/institutional lawn area; *Three towns built bioengineered shoreline stabilization structures in 2008, and three additional towns changed zoning regulations and coastal construction guidelines to require bioengineered methods; *In (2008) four of seven school districts in the Lake Champlain basin and two of five municipalities changed to low input, no phosphorous grounds care practices

V(G). State Defined Outcomes**V. State Defined Outcomes Table of Content**

O. No.	OUTCOME NAME
1	Increase the number of participants who increase the quality and/or quantity of fruits and vegetables
2	Increase in number of people who expand or change their preferences for or attitudes about healthy foods
3	Increase in number of people who improve food planning and shopping behaviors.
4	Increase in number of food managers certified in food safety and sanitation (Action)
5	Increase in number of school food service workers using food safety 'best practices' when receiving, storing, handling, preparing and serving food
6	Increase in number of schools implementing Hazard Analysis Critical Control Point based food safety programs
7	Increase in number of people who show an improvement in healthful eating practices.
8	Increase the number of people who show improvement in food safety and preservation practices.
9	A greater variety of produce available at home.
10	An increased preference for at least one fruit or vegetable
11	Increase the number of home gardeners who implement one or more good agricultural practices to minimize microbial food safety hazards such as using potable water and composted manure. (Action)
12	Increase the number of parents undergoing family transition through parentage, divorce or separation who understand the impact of these changes on their children.
13	Increase the number of parents who intend to apply knowledge and skills learned to influence their behavior with their children.
14	increase in number of food service workers using food safety 'best practices' when receiving, storing, handling, preparing and serving food
15	increase in number of food managers certified in food safety and sanitation
16	Number of parents/caregivers who have more positive feelings about feeding their toddlers than they did prior to the intervention.

Outcome #1**1. Outcome Measures**

Increase the number of participants who increase the quality and/or quantity of fruits and vegetables

2. Associated Institution Types

2009	299	31

3c. Qualitative Outcome or Impact Statement

Issue (Who cares and Why)

Diabetes prevalence is increasing nationally and in Vermont. By comparing Behavioral Risk Factor Surveillance System (BRFSS) average data from 2006-2008 with data from 1999-2001 for Vermont adults over age 65, the total diagnosed diabetes prevalence has increased from 24.9 to 28.3 percent in this short time frame. As the population ages and experiences the effects from overweight and obesity, diabetes prevalence is expected to rise. Due to limited resources other modes of delivery to reach audiences are needed.

What has been done

As a pilot we offered our Dining with Diabetes program (DWD) over Vermont Interactive Television (VIT) for 4 sessions and targeted caregivers of people with diabetes. We adapted program materials, produced food demonstration videos instead of cooking on site, and created various learning activities. Out of 121 participants at 11 VIT sites, approximately 87% of our attendees were caregivers, and 13% were people living with diabetes. Sixty participants completed both pre and post surveys distributed during the first and last class sessions.

Results

Responses show that the pilot done over VIT was considered quite favorably. Attending a course taught over VIT was rated equally to attending a face-to-face class. Of the 60 caregivers who completed the survey they indicated they planned meals for a total of 149 people, shopped for a total of 163, and prepared meals for a total of 189 people. 31 of the caregivers indicated on the post survey they had already changed behaviors using the information learned. One participant shared that after surgery he was self monitoring what he could eat, his doctor was impressed. When a dietary staff person asked if he didn't want carrot cake he told her "no, just bring me a piece of fresh fruit." In the future, we plan on using VIT and possibly other methods to deliver this important Diabetes education program.

2009	{No Data Entered}	120

3c. Qualitative Outcome or Impact Statement

Issue (Who cares and Why)

Poverty, hunger, and food insecurity are all factors that can contribute to poor health and poor nutrition. Often times it is the quality of food that is sacrificed in an effort to make ends meet. Research has shown the consumption of fruits and vegetables consumed by infants and toddlers typically decreases as they transition from their first foods into family meals.

What has been done

Partnering with the Vermont WIC Program parents with six month old babies were enrolled in this intervention over a six month time period in 2006, and then followed until the children reached their second birthdays. The Theory of Planned Behavior provided the theoretical framework. Trainings, targeted support materials, as well as S.M.A.R.T. goal setting were developed and implemented for WIC staff. A cohort design was used while keeping the fruit and vegetable message content similar, was used with program delivery to participants.

Results

An analysis of parent data (750 surveys) showed an overall increase in parental use of strategies to feed fruits and vegetables to their toddlers, and an intention to do even better in the future. 120 parents/caregivers have more positive feelings about feeding their toddlers than prior to the intervention. Although WIC families continued to experience barriers to increasing the amount of fruits and vegetables offered to toddlers, including cost, participating parents, as a group, significantly increased the number of servings of vegetables offered to their toddlers as part of a meal or snack. We conclude that there may be real benefits to providing nutrition counseling/education focused on one topic, in this case fruits and vegetables, for an extended time.

4. Associated Knowledge Areas

KA Code	Knowledge Area
---------	----------------

V(H). Planned Program (External Factors)

External factors which affected outcomes

- Economy
- Appropriations changes
- Competing Public priorities
- Populations changes (immigration, new cultural groupings, etc.)

Brief Explanation

{No Data Entered}

V(I). Planned Program (Evaluation Studies and Data Collection)

1. Evaluation Studies Planned

- Retrospective (post program)
- Before-After (before and after program)
- Time series (multiple points before and after program)
- Comparisons between program participants (individuals, group, organizations) and non-participants
- Comparisons between different groups of individuals or program participants experiencing different levels of program intensity.
