## March 11, 2002

## $\sqrt{\text { Exam \# } 2}$

$\checkmark 7 \mathrm{pm}$, Kalkin 001
$\checkmark$ Exam \# 2 info page now up to date!
$\checkmark$ Monday (today!) problem session
3:00 - 4:00 pm, A531 Cook
$\checkmark$ SGA evaluation test program!
$\checkmark$ Email your comments to me anonymously!
$\checkmark$ Available for 24 fours (March 12 th only)
$\checkmark$ See link on course we bpage

## pH of $\operatorname{S}$ trong $\mathcal{A c i d}$ solutions

Simple - Strong acids dissociate completely:

$$
\mathcal{H C l}(a q) \rightarrow \mathcal{H}^{+}(a q)+\mathcal{C}(a q)
$$

So, what's the $p \mathcal{H}$ of a $0.10 \mathcal{M} \mathcal{H C l}$ solution?

## How about $1.0 \times 10^{-10} \mathfrak{M} \mathcal{H C l}$ ?

As before:

$$
\begin{aligned}
{\left[\mathcal{H}^{+}\right]=\mathcal{C}_{\mathcal{H C l}}=} & 1.0 \times 10^{-10} \mathfrak{M} \\
& p \mathcal{H}=10.00
\end{aligned}
$$

Ooops!There are $\mathcal{T} \mathcal{W O}$ sources of $\mathcal{H}^{+}$:

$$
\begin{aligned}
& \mathcal{H C l}(a q) \rightarrow \mathcal{H}^{+}(a q)+\mathcal{C l}(a q) \\
& \text { and } \\
& \mathcal{H}_{2} O(l) \leftrightarrows \mathcal{H}^{+}(a q)+O \mathcal{H}^{-}(a q)
\end{aligned}
$$

## $\left[\mathcal{H}^{+}\right]$from two reactions

So:

$$
\begin{aligned}
& {\left[\mathcal{H}^{+}\right]=\left[\mathcal{H}^{+}\right]_{\mathcal{H C l}}+\left[\mathcal{H}^{+}\right]_{\mathcal{H} 2 \mathrm{O}}} \\
& {\left[\mathcal{H}^{+}\right]=\mathcal{C}_{\mathcal{H C l}}+\left[O \mathcal{H}^{-}\right]} \\
& {\left[\mathcal{H}^{+}\right]=\mathcal{C}_{\mathcal{H C l}}+\mathcal{K}_{q u} /\left[\mathcal{H}^{+}\right]}
\end{aligned}
$$

It's a quadratic! Rearranging:

$$
\left[\mathcal{H}^{+}\right]^{2}-\mathcal{C}_{\mathcal{H C l}^{2}}\left[\mathcal{H}^{+}\right]-\mathcal{K}_{v}=0
$$

## On to the solution!

$$
\left[\mathcal{H}^{+}\right]^{2}-{\underset{\sim}{\mathcal{H C l}}}_{\mathcal{C}_{1.0}\left[\mathcal{H}^{+}\right]-0^{-10}}^{\mathcal{K}_{\varepsilon v}=0}
$$

Solving for $\left[\mathcal{H}^{+}\right]$, give $s$ :

$$
\begin{aligned}
& {\left[\mathcal{H}^{+}\right]=1.00050 \times 10^{-7} \mathcal{M} \left\lvert\, \begin{array}{l}
\begin{array}{l}
\checkmark \text { Autoionization of } \\
\text { water is the major } \\
\text { source of } \mathcal{H}^{+} \text {in this } \\
\text { solution }
\end{array} \\
n \mathcal{H}=699978=700
\end{array}\right.}
\end{aligned}
$$

$$
p \mathcal{H}=6.99978=\underline{7.00}
$$

## Weak Acids - pH Calculation

> If we have $\mathcal{K}_{a}$ and solution concentration, this is just a straightforward equilibrium problem

Example: Calculate the pH of a $1.0 \times 10^{-1} \mathcal{M} \mathcal{H F}$ solution $\left(\mathcal{K}_{a}=7.2 . X 10^{-4}\right)$.

First, identify the major sources of $\mathcal{H}^{+}$:

## Apply ICE

$$
\overline{\mathcal{H F}(a q)} \leftrightarrows \mathcal{H}^{+}(a q)+\mathcal{F}(a q)
$$

I $1.0 \times 10^{-1} \mathcal{M}$
c

| $-x$ | $+x$ |
| :--- | :--- |

E $1.0 \times 10^{-1}-x \quad x \quad x$
Recall: $\quad \mathcal{K}_{a}=\underline{\left[\mathcal{H}^{+}\right][\mathcal{F}]}=7.2 \times 10^{-4}$

$$
[\mathcal{H F}]
$$

Substituting:

$$
\frac{x^{2}}{1.0 \times 10^{-1}-x}=7.2 \times 10^{-4}
$$

## Quadratic Formula?

Rearranging:

$$
x^{2}+7.2 \times 10^{-4} x-7.2 \times 10^{-5}=0
$$

Substituting:

$$
x=\frac{-7.2 \times 10^{-4} \pm 1.6986 \times 10^{-2}}{2}
$$

Finally: $\quad x=8.1329 \times 10^{-3}=\left[\mathcal{H}^{+}\right]$

$$
p \mathcal{H}=2.0897=\underline{2.09}
$$

## Successive Approximations?

$$
\frac{x^{2}}{1.0 \times 10^{-1}-x}=7.2 \times 10^{-4}
$$

$$
\begin{gathered}
\frac{\left(x^{\prime}\right)^{2}}{1.0 \times 10^{-1}}=7.2 \times 10^{-4} \\
x^{\prime}=8.4853 \times 10^{-3}
\end{gathered}
$$

$$
\frac{\left(x^{\prime \prime}\right)^{2}}{1.0 \times 10^{-1}-8.4853 \times 10^{.3}}=7.2 \times 10^{-4} \quad \underline{2 n d ~ a p p r o x}
$$

$$
x^{\prime \prime}=8.11730 \times 10^{-3} \quad p \mathcal{H}=2.09
$$

$$
4.5 \% \text { change - S top! }
$$
