1. a. As you all recall from lab, Aspirin is a weak acid (acetylsalicylic acid). When a 0.150 M solution of this acid is prepared, it has a pH of 4.69. Calculate the $K_a$ for acetylsalicylic acid.

$$K_a = 2.8 \times 10^{-9}$$

b. Calculate $K_b$ for the acetylsalicylate ion.

$$K_b = 3.6 \times 10^{-6}$$

c. Calculate the pH of a 0.150 M solution of sodium acetylsalicylate.

$$pH = 10.87$$

2. The following reaction mechanism has been proposed for a chemical reaction:

$$\begin{align*}
2 A + B & \rightleftharpoons D \\
D + B & \rightarrow E + F \\
F & \rightarrow G
\end{align*}$$

(a fast equilibrium)

(a slow)

(a fast)

a. Write a balanced equation for the overall reaction.

$$2A + 2B \rightarrow G + E$$

b. Write the rate law that corresponds to the preceding mechanism. Express the rate in terms of concentrations of reactants only (A, B).

$$\text{Rate} = (k_2 k_1 / k_{-1}) [A]^2 [B]^2$$

c. Identify the reactive intermediates involved in this reaction mechanism.

**Reactive Intermediates: D and F (not in overall reaction)**
4. In a study of the reaction of pyridine (C₅H₅N) with methyl iodide (CH₃I) in a benzene solution, the following set of initial reaction rates was measured at 25 °C for different initial concentrations of the two reactants:

<table>
<thead>
<tr>
<th>[Pyridine] (mol/L)</th>
<th>[Methyl Iodide] (mol/L)</th>
<th>Rate (mol/L/sec)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.00100</td>
<td>0.00100</td>
<td>5.0 x 10⁻⁷</td>
</tr>
<tr>
<td>0.00100</td>
<td>0.00200</td>
<td>1.0 x 10⁻⁶</td>
</tr>
<tr>
<td>0.00200</td>
<td>0.00200</td>
<td>2.0 x 10⁻⁶</td>
</tr>
</tbody>
</table>

a. Write the rate law for this reaction.

$$\text{Rate} = k[C₅H₅N][CH₃I]$$

b. Calculate the rate constant k, and give its units.

$$k = 5.0 \times 10^{-1} \text{ L/mol-s}$$

c. Predict the initial reaction rate for a solution in which [C₅H₅N] is 5.0 x 10⁻⁵ M and [CH₃I] is 2.0 x 10⁻⁵ M.

$$\text{Rate} = 5.0 \times 10^{-10} \text{ mol/L-s}$$

5. a. The reaction SO₂Cl₂ (g) → SO₂ (g) + Cl₂ (g) is first-order, with a rate constant equal to 1.7 x 10⁻⁴ s⁻¹ at 550 K. If the partial pressure of SO₂Cl₂ in a sealed vessel at 550 K is 1.0 atm, how long will it take for the partial pressure of SO₂Cl₂ to fall to 0.50 atm?

$$4.1 \times 10^3 \text{ sec}$$

b. At a temperature of 600 K, this reaction has a rate constant of 4.8 x 10⁻³ s⁻¹. Calculate the activation energy (kJ/mol) for this reaction.

$$E_a = 1.8 \times 10^2 \text{ kJ/mol}$$
6. The isotope $^{232}$Th decays to $^{208}$Pb by the emission of six alpha particles, with a half-life of $1.39 \times 10^{10}$ years.

a. Write a balanced reaction for this decay process.

$$ ^{232}_{90}\text{Th} \rightarrow ^{208}_{82}\text{Pb} + 6 ^{4}_{2}\text{He} + 4 ^{0}_{-1}\text{e} $$

b. Analysis of 1.0 kg of ocean sediment show it to contain 7.4 mg of $^{232}$Th and $4.9 \times 10^{-2}$ cm$^3$ of gaseous helium at 0 °C and atmospheric pressure. Calculate the age of the sediment, assuming no loss or gain of thorium or helium from the sediment since its formation and assuming that the helium arose entirely from the decay of thorium.

$2.3 \times 10^8$ years

7. You may recall that spectacular demonstration in which the following gas phase acid-base reaction was performed:

$$ \text{NH}_3(g) + \text{HCl}(g) \rightarrow \text{NH}_4\text{Cl}(s) $$

a. Would you expect the entropy change associated with this reaction to be positive or negative? (No calculations, just base your answer on inspection of the reaction equation.) Briefly explain.

$\Delta S = \text{negative}$

$2 \text{ mol gas} \rightarrow \text{solid, so entropy of the system will decrease as it becomes more ordered.}$

b. Obviously, this reaction is spontaneous at 25 °C. Based on this and on your answer to part a, is this reaction exothermic or endothermic? Explain.

$$ \Delta G = \Delta H - T\Delta S $$

If $\Delta S$ is negative, then $-T\Delta S$ will be positive. Thus, $\Delta H$ must be negative in order for the process to be spontaneous ($\Delta G = \text{negative}$): Exothermic
c. This reaction is between a strong acid and a weak base. Ignoring all of the thermodynamic data for a moment, do you expect the equilibrium constant for this reaction to be much less than 1.0, much greater than 1.0, or about equal to 1.0. Explain.

The reaction of any strong acid with any base will go to completion and so \( K \gg 1 \)

d. \( \Delta G^0 \) for this reaction is -91.2 kJ/mol. Calculate the value of the equilibrium constant for this reaction.

\[
K = 1. \times 10^{16}
\]

e. If you were to place \( 1.0 \times 10^{-5} \) atm each of \( \text{NH}_3 \) (g) and \( \text{HCl} \) (g) into a 500-mL flask, how much \( \text{NH}_4\text{Cl} \) (s) will form when the system reaches equilibrium?

\[10.9 \, \mu \text{g}\]

8. Indicate whether the aqueous solutions described in each instance below are acidic, basic, or neutral (pH=7). Either show your work or explain your reasoning.

a. \( 1.0 \times 10^{-2} \) M Sodium Acetate (NaAc) solution (\( K_a \) (HAc) = 1.8 \( \times 10^{-5} \)).

**Basic** - acetate is the conjugate base of acetic acid

b. \( 1.0 \times 10^{-2} \) M NaNO\(_3\) solution.

**Neutral** - water determines the pH of this solution

c. Solution obtained by mixing 20.0 mL 0.100 M HCl with 20.0 mL 0.010 M \( \text{NH}_3 \) (\( K_b \) (NH\(_3\)) = 1.8 \( \times 10^{-5} \)).

**Acidic** - excess HCl

d. Solution obtained by mixing 20.0 mL 0.010 M HCl with 20.0 mL 0.100 M \( \text{NH}_3 \) (\( K_b \) (NH\(_3\)) = 1.8 \( \times 10^{-5} \)).

**Basic** - buffer composed of a base and its conjugate acid
e. 1.0 \times 10^{-2} \text{ M Na}_2\text{HPO}_4 \text{ solution. (For phosphoric acid, H}_3\text{PO}_4: K_{a1} = 7.5 \times 10^{-3}, K_{a2} = 6.2 \times 10^{-8}, K_{a3} = 2.2 \times 10^{-13})}

\text{Basic - amphoteric species, but } K_b > K_a

f. Solution obtained by mixing 20.0 mL 0.100 M H$_3$PO$_4$ with 20.0 mL 0.300 M NaOH (see $K_a$ values from part e).

\text{Basic - left with PO}_4^{3-} \text{ (conjugate base) after reaction}

9. An I$_2$ (s)||I$^-$ (1.00 M) half-cell is connected to an H$_3$O$^+$|H$_2$ (1 atm) half-cell in which the concentration of the hydronium ion is unknown. The measured cell voltage is 0.755 volts when the I$_2$ (s)||I$^-$ (1.00 M) half-cell is the cathode. What is the pH in the H$_3$O$^+$|H$_2$ (1 atm) half-cell?

\text{pH} = 3.72
