## Basics:

- ▶ **Instructor:** Prof. Peter Dodds
- ▶ **Lecture room and meeting times:**  
307 Lafayette, Tuesday and Thursday, 10:00 am to 11:30 pm
- ▶ **Office:** 203 Lord House, 16 Colchester Avenue
- ▶ **E-mail:** pdodds@uvm.edu
- ▶ **Website:**  
<http://www.uvm.edu/~pdodds/teaching/2009-08UVM-300/> (田)
- ▶ **Suggested Texts:**
  - ▶ “Critical Phenomena in Natural Sciences: Chaos, Fractals, Selforganization and Disorder: Concepts and Tools” by Didier Sornette<sup>[12]</sup>.
  - ▶ “Critical Mass: How One Thing Leads to Another” by Philip Ball<sup>[3]</sup>

## Grading breakdown:

- ▶ **Projects/talks (55%)**—Students will work on semester-long projects. Students will develop a proposal in the first few weeks of the course which will be discussed with the instructor for approval. Details: 15% for the first talk, 20% for the final talk, and 20% for the written project.
- ▶ **Assignments (40%)**—All assignments will be of equal weight and there will be three or four of them.
- ▶ **General attendance/Class participation (5%)**

## How grading works:

Questions are worth 3 points according to the following scale:

- ▶ 3 = correct or very nearly so.
- ▶ 2 = acceptable but needs some revisions.
- ▶ 1 = needs major revisions.
- ▶ 0 = way off.

## Schedule:

Week # (dates)	Tuesday	Thursday
1 (9/1, 9/3)	guest lecture: Josh Bongard	lecture
2 (9/8, 9/10)	lecture	lecture
3 (9/15, 9/17)	lecture	lecture
4 (9/22, 9/24)	Project presentations	Project presentations
5 (9/28, 10/1)	lecture	lecture
6 (10/6, 10/8)	lecture	lecture
7 (10/13, 10/15)	lecture	lecture
8 (10/20, 10/22)	lecture	lecture
9 (10/27, 10/29)	lecture	lecture
10 (11/3, 11/5)	lecture	lecture
11 (11/10, 11/12)	lecture	lecture
12 (11/17, 11/19)	lecture	lecture
13 (11/24, 11/26)	Thanksgiving	Thanksgiving
14 (12/1, 12/3)	lecture	lecture
15 (12/8, 12/10)	Project Presentations	Project Presentations

## Important dates:

1. Classes run from Monday, August 31 to Wednesday, December 9.
2. Add/Drop, Audit, Pass/No Pass deadline—Monday, September 14.
3. Last day to withdraw—Friday, November 6.
4. Reading and exam period—Thursday, December 10 to Friday, December 18.

# Projects

The **narrative hierarchy**—explaining things on many scales:

- ▶ 1 to 3 word encapsulation, a soundbite,
- ▶ a sentence/title,
- ▶ a few sentences,
- ▶ a paragraph,
- ▶ a short paper,
- ▶ a long paper,
- ▶ a chapter,
- ▶ a book,
- ▶ ...

# Topics:

## Measures of complexity

## Scaling phenomena

- ▶ Zipf's law
- ▶ Non-Gaussian statistics and power law distributions
- ▶ Sample mechanisms for power law distributions
- ▶ Organisms and organizations
- ▶ Scaling of social phenomena: crime, creativity, and consumption.
- ▶ Renormalization techniques

# Topics:

## Multiscale complex systems

- ▶ Hierarchies and scaling
- ▶ Modularity
- ▶ Form and context in design

## Complexity in abstract models

- ▶ The game of life
- ▶ Cellular automata
- ▶ Chaos and order—creation and maintenance

Frame 20/108

## Topics:

### Integrity of complex systems

- ▶ Generic failure mechanisms
- ▶ Network robustness
- ▶ Highly optimized tolerance: Robustness and fragility
- ▶ Normal accidents and high reliability theory

### Complex networks

- ▶ Small-world networks
- ▶ Scale-free networks

References

Frame 21/108

## Topics:

### Collective behavior and contagion in social systems

- ▶ Percolation and phase transitions
- ▶ Disease spreading models
- ▶ Schelling's model of segregation
- ▶ Granovetter's model of imitation
- ▶ Contagion on networks
- ▶ Herding phenomena
- ▶ Cooperation
- ▶ Wars and conflicts

Measures of Complexity

References

Frame 22/108

## Topics:

### Large-scale Social patterns

- ▶ Movement of individuals

### Collective decision making

- ▶ Theories of social choice
- ▶ The role of randomness and chance
- ▶ Systems of voting
- ▶ Juries
- ▶ Success inequality: superstardom

# Definitions

**Complex:** (Latin = with + fold/weave (com + plex))

**Adjective:**

1. Made up of multiple parts; intricate or detailed.
2. Not simple or straightforward.

Frame 26/108

# Definitions

Possible properties of a **Complex System**:

- ▶ Many interacting agents or entities
- ▶ Relationships are nonlinear
- ▶ Presence of feedback
- ▶ Complex systems are open (out of equilibrium)
- ▶ Presence of memory
- ▶ Modular/multiscale/hierarchical structure
- ▶ Evidence of emergence properties
- ▶ Evidence of self-organization

Frame 29/108

# Definitions

## Complicated versus Complex.

- ▶ Complicated: Mechanical watches, airplanes, ...
- ▶ Engineered systems can be made to be **highly robust but not adaptable**.
- ▶ But engineered systems can become complex (power grid, planes).
- ▶ They can also fail spectacularly.
- ▶ Explicit distinction: Complex Adaptive Systems.

## Definitions

Cosma Shalizi:

“The "sciences of complexity" are very much a potpourri, and while the name has some justification—chaotic motion seems more complicated than harmonic oscillation, for instance—I think the fact that it is more dignified than "neat nonlinear nonsense" has not been the least reason for its success.—That opinion wasn't exactly changed by working at the Santa Fe Institute for five years.”

## Definitions

Nonlinear (OED)

1. a. Math. and Physics. Not linear; ... involving or possessing the property that the magnitude of an effect or output is not linearly or proportionally related to that of the cause or input. First cited use 1844.

## Welcome to the COMPLEXITY SOCIETY

**"The Application of Complexity Science to Human Affairs"**

**Membership**  
To join TCS apply here.

**Complexity Society Newsletter**  
The August 2007 edition is now available.

**Complexity Society**  
The current issue of Complexity Society 2007.29 is now available on-line.

**Recent Events**  
Summer School in Complexity Science organised by Imperial College, London, Wye College, Kent, UK. 8-17th July 2007.

**Upcoming Events**  
ECS 07 European Conference on Complex Systems, Dresden, Germany. 1-5th October 2007.

**New Paper**  
The Fractal Imagination: New Resources for Conceptualising Creativity.

**Journal**  
"Emergence: Complexity & Organization" (ECO): A Journal of research, theory and practice on organisations as complex systems.

The Complexity Society provides a focal point for people in the UK interested in complexity. It is a community that uses complexity science to rethink and reinterpret all aspects of the world in which we live and work.

Its core values are OPENNESS, EQUALITY and DIVERSITY.

- Open to all, open to ideas, open in process and activities
- Equality, egalitarian, non-hierarchical, participative
- Diverse, connecting and embracing a wide range of views, respecting differences

The society objectives are to promote the theory of complexity in education, government, the health service and business as well as the beneficial application of complexity in a wide variety of social, economic, scientific and technological contexts such as sources of competitive advantage, business clusters and knowledge management.

Complexity includes ideas such as complex adaptive systems, self-organisation, co-evolution, agent based computer models, chaos, networks, emergence and fractals.

Membership is open to all and current members include people from universities, business, and government funded organisations.

# Emergence

## Friedrich Hayek (Economist/Philosopher/Nobelist):

- ▶ Markets, legal systems, political systems are emergent and not designed.
- ▶ ‘Taxis’ = made order (by God, Sovereign, Government, ...)
- ▶ ‘Cosmos’ = grown order
- ▶ Archetypal limits of **hierarchical** and **decentralized** structures.
- ▶ Hierarchies arise once problems are solved.
- ▶ **Decentralized structures** help solve problems.
- ▶ Dewey Decimal System versus tagging.

# Emergence

Even mathematics:<sup>[9]</sup>

Gödel's Theorem (roughly):  
we can't prove every theorem that's true.

Suggests a **strong form of emergence**:

Some phenomena cannot be formally deduced from elementary aspects of a system.

# Emergence

The idea of emergence is rather old...

“The whole is more than the sum of its parts” –Aristotle

Philosopher G. H. Lewes first used the word explicitly in 1875.

# Definitions

There appears to be **two types of emergence**:

**Weak emergence:**

System-level phenomena is different from that of its constituent parts yet can be connected theoretically.

**Strong emergence:**

System-level phenomena fundamentally cannot be deduced from how parts interact.

(Strong emergence is what Mark Bedau calls **magic**...)

## Definitions

Complex Systems enthusiasts often decry **reductionist** approaches . . .

But reductionism seems to be misunderstood.

**Reductionist** techniques can explain weak emergence (e.g., phase transitions).

'A Miracle Occurs' explains strong emergence.

## Reductionism

### Reductionism and food:

- ▶ **Pollan**: “even the simplest food is a hopelessly complex thing to study, a virtual wilderness of chemical compounds, many of which exist in complex and dynamic relation to one another...”
- ▶ “So ... break the thing down into its component parts and study those one by one, even if that means ignoring complex interactions and contexts, as well as the fact that the whole may be more than, or just different from, the sum of its parts. This is what we mean by reductionist science.”

# Upshot

- ▶ The central concepts **Complexity** and **Emergence** are not precisely defined.
- ▶ There is as yet **no general theory of Complex Systems**.
- ▶ But the problems exist...  
Complex (Adaptive) Systems abound...
- ▶ Framing: Thinking about systems is essential today.
- ▶ We use whatever tools we need.

Frame 99/108

Hmmm

Two ways for order to appear in a system without offending the second law of thermodynamics:

(1) Entropy of the system decreases at the expense of entropy increasing in the environment.

(2) The system becomes more ordered macroscopically while becoming more disordered microscopically.

# Measures of Complexity

So maybe no one true measure of complexity exists.

**Cosma Shalizi:**

“Every few months seems to produce another paper proposing yet another measure of complexity, generally a quantity which can’t be computed for anything you’d actually care to know about, if at all. These quantities are almost never related to any other variable, so they form no part of any theory telling us when or how things get complex, and are usually just quantification for quantification’s own sweet sake.”

Overview

Course Information  
Major Centers  
Resources  
Projects  
Topics

Fundamentals  
Complexity  
Emergence  
Self-Organization  
Modeling  
Statistical Mechanics  
Universality  
Symmetry Breaking  
The big theory  
Tools and Techniques  
Measures of Complexity

References
