STUDENT GUIDE

to accompany

Statistical Methods for Psychology

Sixth Edition
2007

by

David C. Howell
The solutions for each chapter are as follows:

Solutions for Chapter 1 Basic Concepts ................................................................. page 1
Solutions for Chapter 2 Describing and Exploring Data ........................................... 3
Solutions for Chapter 3 The Normal Distribution .................................................. 12
Solutions for Chapter 4 Sampling Distributions and Hypothesis Testing ............... 16
Solutions for Chapter 5 Basic Concepts of Probability ............................................. 19
Solutions for Chapter 6 Categorical Data and Chi-Square ...................................... 23
Solutions for Chapter 7 Hypothesis Tests Applied to Means .................................. 31
Solutions for Chapter 8 Power .............................................................................. 39
Solutions for Chapter 9 Correlation and Regression ............................................. 44
Solutions for Chapter 10 Alternative Correlational Techniques ............................... 52
Solutions for Chapter 11 Simple Analysis of Variance .......................................... 57
Solutions for Chapter 12 Multiple Comparisons Among Treatment Means ........... 66
Solutions for Chapter 13 Factorial Analysis of Variance ....................................... 76
Solutions for Chapter 14 Repeated-Measures Designs ......................................... 87
Solutions for Chapter 15 Multiple Regression ..................................................... 99
Solutions for Chapter 16 Analyses of Variance and Covariance as General Linear Models .... 104
Solutions for Chapter 17 Log-Linear Analysis ..................................................... 112
Solutions for Chapter 18 Resampling and Nonparametric Approaches to Data .......... 116

**General Notes**

These solutions were checked using a variety of calculators and computer software. Answers often differ (sometimes a surprising amount) depending on how many decimal places the calculator or program carries. It is important not to be too concerned about differences, especially ones in the second or third decimal place, which may be attributable to rounding (or the lack thereof) in intermediate steps.

Although I do not provide detailed answers to all discussion questions, for reasons given elsewhere, I have provided pointers for what I am seeking for many (though not all) of them. I hope that these will facilitate using these items as a basis of classroom discussion. Students sometimes complain that only answers to the odd numbered items are given. This is because instructors often request that answers not be given to all items because of the way they wish to use them as exercises or exam questions. Some answers refer, by necessity, to answers to even numbered questions, for which I do not supply answers. I have tried to minimize that as much as possible, but some such references still exist in places where I had no way around it.
