Elevation

Jones Gap Rd. 2400

12" spruce with a dozen or so saplings in BBM woods. Beech copse alternate with Hay-scented glades. Spruce may be relict on the lower slopes, 2nd generation of any not cut, rather than seeding in from above, according to Ed West (^{Ed is probably correct (7/21/85)} ~~this is debatable~~). Spruce cut in the West Kill Valley ca. 1850-1870, and maybe later again for Sugar YB. Beech sprung up after spruce was cut, and if forest here was all spruce there should be no old beech remaining. Spruce scattered at lean-to site.

2650

Spruce to 12", some in canopy, some in understorey, but only scattered. One red oak seedling and common maple-leaf viburnum.

2720

Parraw, Ranunculus acris.

2810

A straight clearing running up & down-slope looks like an old road, but isn't. It is a rocky hill after rains and overgrown with raspberry. A 22" YB dying on top, but not dead, has a cleft in its bole on the N side. Ed West thinks it is a fire scar - the tree was burned, but not killed, & the scar surrounded by cambial growth. A sugar just east of it, 31" also with a scar? on the NE. The fire could have been earlier than the 1909 Hunter Mtn fire, since the Fenwick lumber company did not own Rusk. [Check 1891 fire on NYFARY]

2960

18" Cherry also shows burn? scar on NNE. Sugar maple fire-scared to 24" and over 150 years old [Ed West]. No spruce here.

3020

BBM still good site, no stunting, trees to 60 ft plus tall. Tree seedlings, Viola, Carex, Aster, Rubus, Ribes, Canada violet, Caulophyllum on ground.

R-P-64
3000'

3300

Grade begins to taper. Fragmented boulders off disintegrated ledges. Scattered fir enter to 4" DBH. Hardwoods shorter, more open canopy. More Oxalis, Maianthemum, Rubus, Moosewood,

370-2

Mfr Maple, some sugar maples. Medium size first large spruce mixed in, but scattered - not dominant.

3460 Steep boulder ledge fragmenting with scrubby hardwood and scattered large spruce.

3550 Enter ridgecrest. Turn west. Soon, 12" sugar maples to 30 ft.

Open scrubby mfr maple, ^{which black} cherry, Vib aln, MB, moose, Aralia, AA, Dryop spin. A partial look at atop a ledgelet shows the east (3640) summit dominated by large spruce. Col has a small trace of large spruce.

3680 Summit of RusK. Canister on NN end of flat summit, on N side of 11" balsam. Unmarked trails converge. Fir-Maple-Cherry-PB and a handful of spruce on the summit - one 10" x 30' with a dead top W of the coniferfir. Semi-open with Aralia, Veratrum, Rubus, Dennstaedtia, D. spinulosa, Maianthemum. A rough eye-estimate (no transect made) might yield 50% spinulosa, 20% AA-Solidag, 10% Rubus, allegt Vib aln for herb-shrub. Ca. 50% of free opens are balsam, many dead or dying. Ground layer is mostly Ox, Maianth, Clft, some Aralia. A few seedlings of fir are present, enough to maintain the species.

3530 Col. Spruce grove on wet flat, NE of where the crest was attained. Sphagnum, larch, Carex brunnescens. Several dozen large spruce, up to 23" x 60 (80?) ft., with ample reproduction for maintaining the stand.

3500 Col. Holwds: Cherry, sugar PB. In open areas, ferns cover Ox, CB, MC, but in shade the ground cover is less covered. A few balsam ^{to 6"} still hanging on - no reproduction.

3530 (3540 on map) Central knob. Spruce ^{small} grace, ^{to 60' high} on top with some reproduction, but probably not enough to maintain. Changes quickly back

370-3

To hardwood. Balsam scattered to 5' x 20' hardwoods to 30'.

3640

On W side of E Knob, a 29.4" spruce with its top off, about 40' high. Scattered large spruce, some dead. Dense repro S+F in almost equal nos. on very summit of dome-like knob. 10x1" on ca. 15-20 years old. Nearly impenetrable. Unmarked trail that follows the crest passes to south of the knob to avoid the thicket. The 1950 hurricane could have started some of the big spruce going, opening the canopy to the saplings. S+F 5-15' high x 1-2" DBH, averaging several feet apart and many thousand to the acre. In addition to large spruce, MBt fir run up to 24" DBH or seed sources. The thicket runs down the SE slope of the knob, the unmarked trail running through less dense portions & climbing back on to the crest.

3355

Large spruce giving way to hardwood.

3330

Large spruce out. Scrub hardwoods: mgh maple, ph cherry, sugar, MB.

3180

Young scrubby hardwoods to 30': MB, Sug & Red Maple, McGawed.

E.P. 63
3100'

Maianth- Dennst. Threnalis- AA. Steep downgrade 30 to 40°, with a few easy & disintegrating ledges.

2995

Cross old log road running up to NE in very poor condition. Ed West discerned it. Some young hemlock in the area. 2" hardwoods to 50' height a few 8" spruce. No trees over 12" DBH.

2800

Enter Hunter Mt. Truck trail. This was an old wagon road from Spruce to Hunter closed in the 1930's and improved for NYSD vehicles only. State bought Hunter around 1920 or 1922 [Ed West].

Evergreen: From Rusk 3680 summit, glimpses of Evergreen show conifers - not large, probably fir. **NONE 10/72**
