White Pine Needle Damage (WPND)

1. Fungal Pathogens Responsible
2. Role of Climate Change
3. Effect on White Pines
4. Management Strategies

Eastern White Pine in Massachusetts

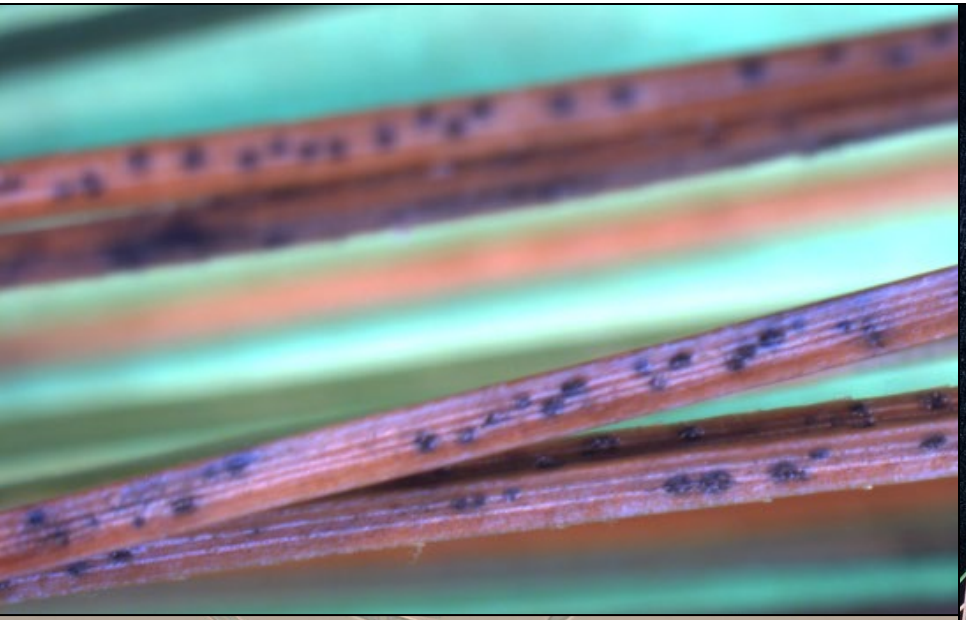
- EWP comprises 12% of all forest trees >1” dbh (second only to red maple) – FIA 2024

FIA Datamart (2024)
https://apps.fs.usda.gov/fia/datamart/datamart.html

White Pine Needle Damage (WPND)

White Pine Needle Damage (WPND)

Septorioides Needle Blight (*Septorioides strobi*)



Brown Needle Spot (*Lecanosticta acicola*)

WPND Disease Cycle

1. Late May to mid-June 2025: 2nd (and 3rd) year needles turn brown and are shed

2. (May) **June** (July-August) 2025: Fungal pathogens sporulate from diseased needles and infect newly emerging needles

3. Late summer 2025 through spring 2026: Symptoms of WPND may appear

Effect of Climatic Variables on Abundance and Dispersal of *Lecanosticta acicola* Spores and Their Impact on Defoliation on Eastern White Pine

WPND-Induced Growth Decline

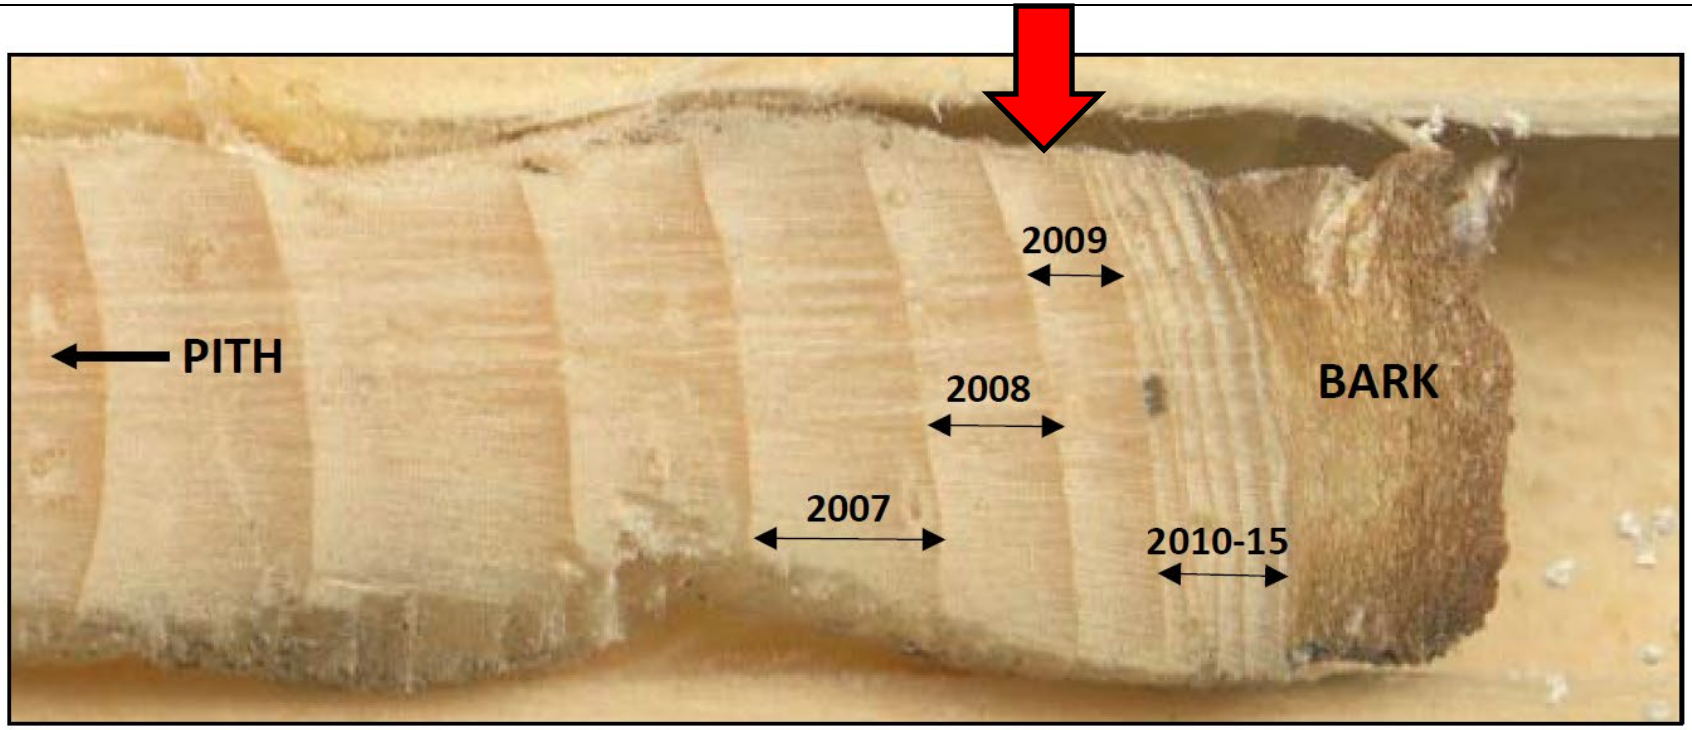

Figure 4. A tree core extracted from the Mohawk Trail State Park, Charlemont, MA. The onset of the outbreak is clearly visible after 2009. The post-outbreak ring widths (2010-15) are significantly reduced over this six-year period following WPND infection.

Photo by Cameron McIntire (USFS, Durham, NH)

McIntire *et al*. (2021) Trees 35: 357–373

1. Exhibit higher rates of photosynthesis
2. Use less water (better efficiency)

- Diseased trees prioritize **storage** of non-structural carbohydrates over annual growth

Management of WPND

ELSEVIER

Forest Ecology and Management

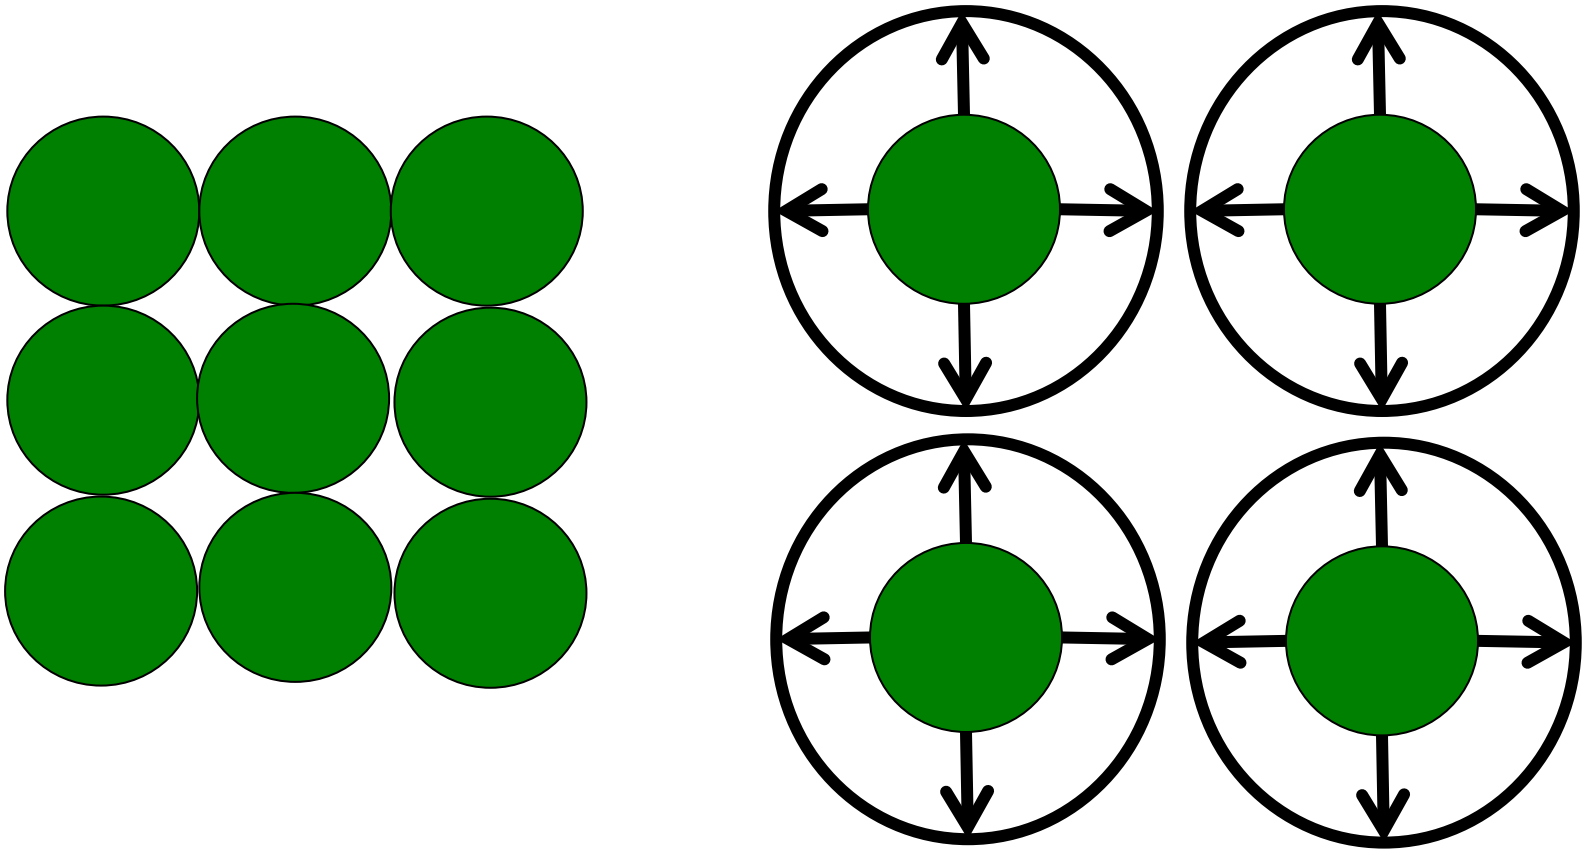
Volume 423, 1 September 2018, Pages 106-113

Thinning treatments reduce severity of foliar pathogens in eastern white pine ☆

Cameron D. McIntire [a], Isabel A. Munck [b], Mark J. Ducey [a], Heidi Asbjornsen [a c]

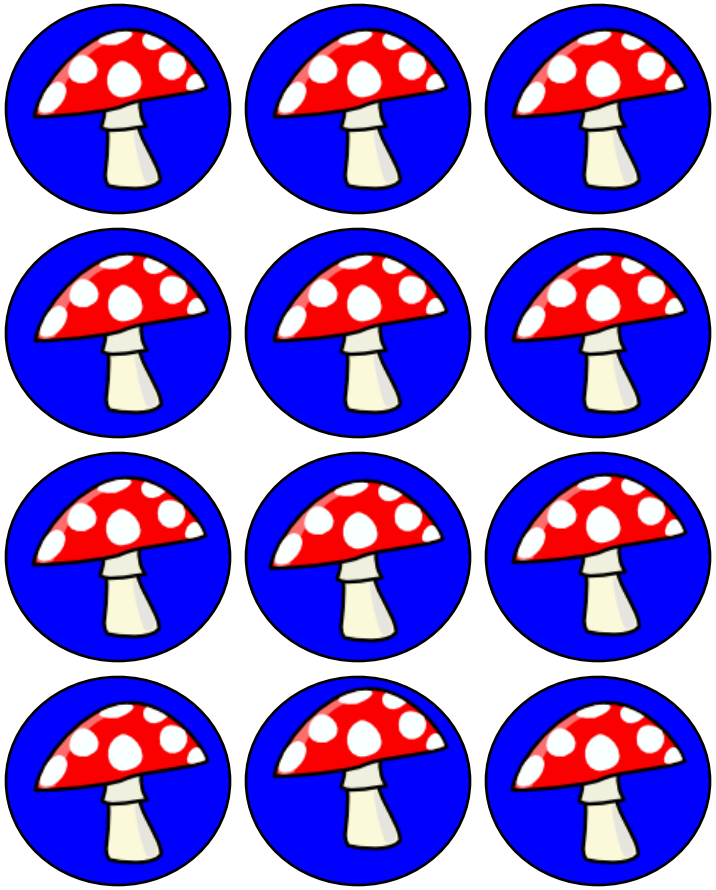
- Nitrogen fertilization (chronic starvation due to needle loss)
- Increased stand diversity

Height Growth Repression and low LCR



LCR <30% = decrease in vigor

Natural Environment vs. Monoculture



Stress > Opportunistic Pathogens

Armillaria

Caliciopsis
