

VALUE OF PUBLIC TREES AT RISK

Invasive pests and pathogens can kill public trees, resulting in losses of critical ecosystem services, like carbon sequestration, runoff mitigation, and air pollution removal. For each invasive threat, the annual benefits provided by all potential host trees are summed into a total potential loss. In addition to the loss of benefits, the cost of replacing dead trees is estimated as the total structural cost. Together, these values can be used to weigh the potential benefit losses and costs that a municipality may incur if the invasive pest or pathogen is not contained.

MUNICIPALITY

ESSEX

COUNTY

MIDDLESEX

STATE

CONNECTICUT

POPULATION

6,683

INVENTORY YEAR

2020

LEGEND

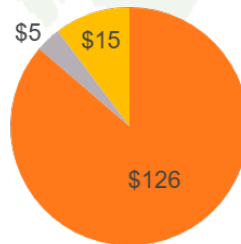

- Gross Carbon Sequestration (\$/yr)
- Avoided Runoff (\$/yr)
- Air pollution removal (\$/yr)

EMERALD ASH BORER

Total number of host trees¹
28

Total annual value²
\$144

Total structural value³
\$162,624

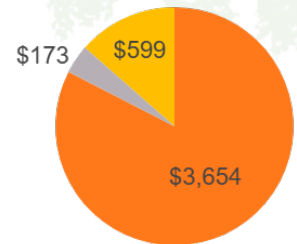

SPOTTED LANTERNFLY

Total number of host trees¹
1,056

Total annual value²
\$4,424

Total structural value³
\$5,435,942

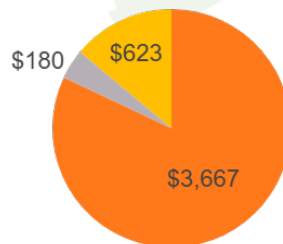

GYPSY MOTH

Total number of host trees¹
1,171

Total annual value²
\$4,469

Total structural value³
\$5,510,260

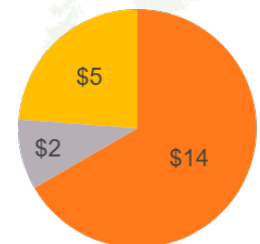

HEMLOCK WOOLLY ADELGID

Total number of host trees¹
9

Total annual value²
\$20

Total structural value³
\$32,348

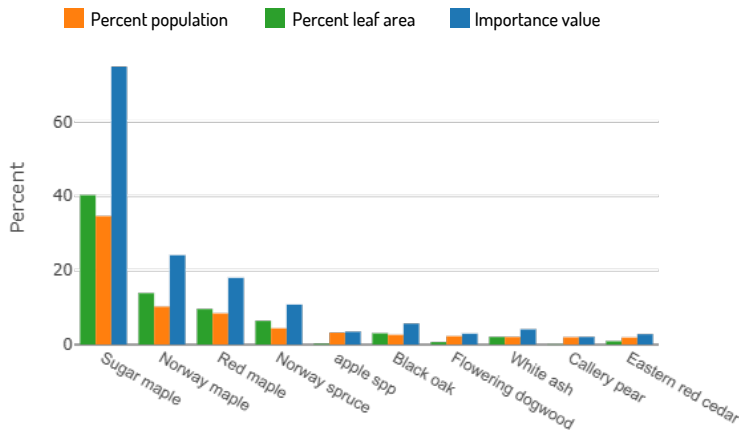

¹Total number of host trees includes any species or genus designated as a favored or occasional host of the pest or pathogen.

²Total annual value is the sum of the annual valuations of gross carbon sequestration, avoided runoff, and pollution removal.

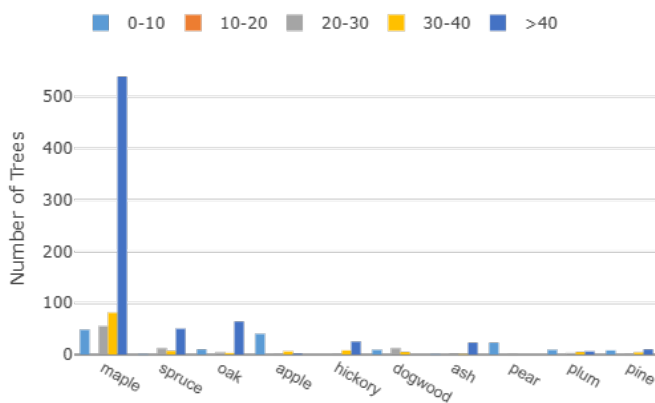

³Total structural value is the estimated local cost of having to replace similar trees and can be interpreted as the value at risk of being lost.

OVERVIEW OF TREE INVENTORY

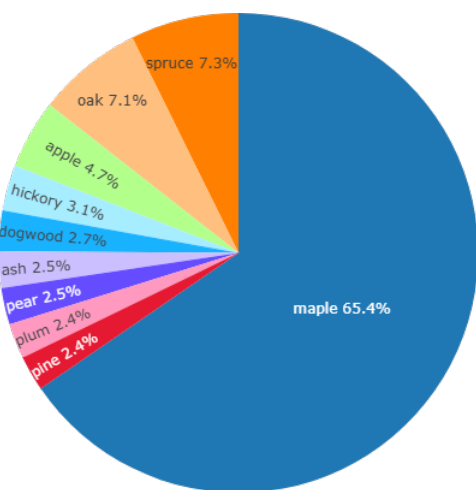

THE PERCENT POPULATION, PERCENT LEAF AREA, AND IMPORTANCE VALUE FOR THE 10 MOST ABUNDANT TREE SPECIES IN THE INVENTORY

DIAMETER DISTRIBUTION BY GENUS

PROPORTION OF TREES BY GENUS

Percent population is the proportion of trees of this species relative to the entire inventory. Leaf area is a measure of a tree's canopy cover; it is displayed here per species relative to the leaf area for all of the trees in the inventory. Importance value is a measure of how dominant a species is in the urban landscape and is calculated as the sum of the percent population and percent leaf area.

Diameter size classes (in inches) for the 10 most abundant genera in the inventory.

The proportion of inventoried trees displayed by genus. For clarity, only the 10 most common genera recorded in the inventory are displayed.
