

Bog #338 on 9/5/16:

Fern glades

167-0

A few fir on high ledge just W of Curtis-Olmabee Monument

The fern glade between West summit 3300' and Bog #338 is BIG, although there are a few more small DP glades along the crest. The BIG glade must be $>1/2$ acre with a textbook example of DP in full sun + *Campyloptera* in partial shade.

Campyloptera is along the crest Wildcat mainly, not much on the shoulders.

The BIG glade was 1st noticed on 6/13/00 (see p. 167-10A)

Two 3300' summits at NE end of Wildcat Ridge have gentle slopes leading up to them EXCEPT the east side of the West Summit which has a more abrupt moderate 20ft pitch leading out of the col. 9/5/16
