

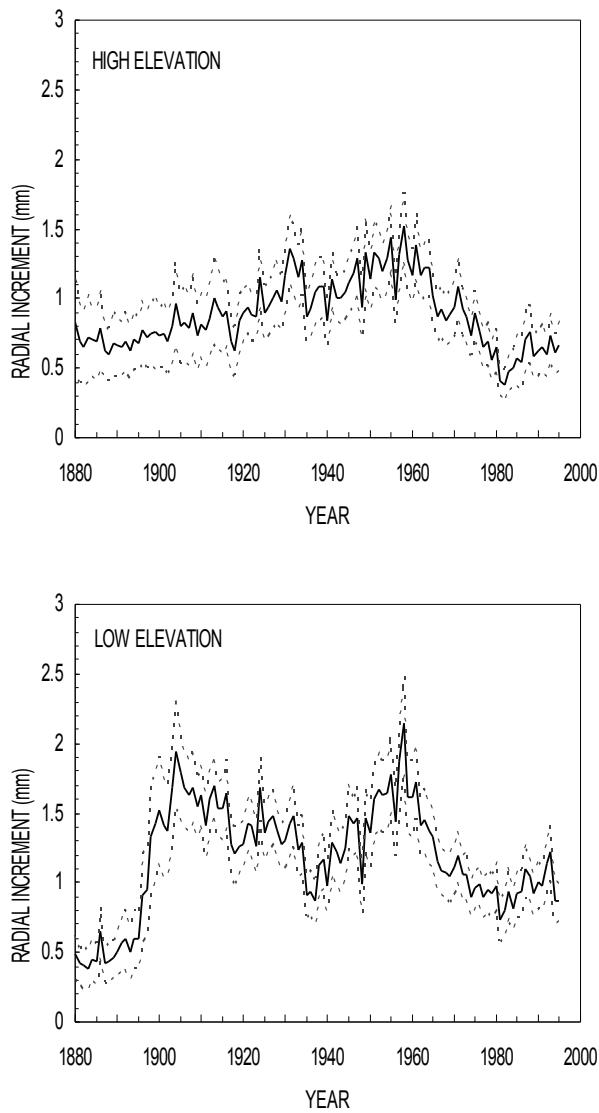

Figure 1 Updating red spruce growth trends

Figure 1: Mean annual radial growth of red spruce. Trees are from high (N=38) and low (N=45) elevations on Mt. Mansfield (VT), Mt. Washington (NH), and Whiteface Mt. (NY). Dashed lines indicate 95% confidence interval (+/- 2 standard errors of the mean). Only trees >70 years old were used in the analyses; sample size prior to 1925 is variable.

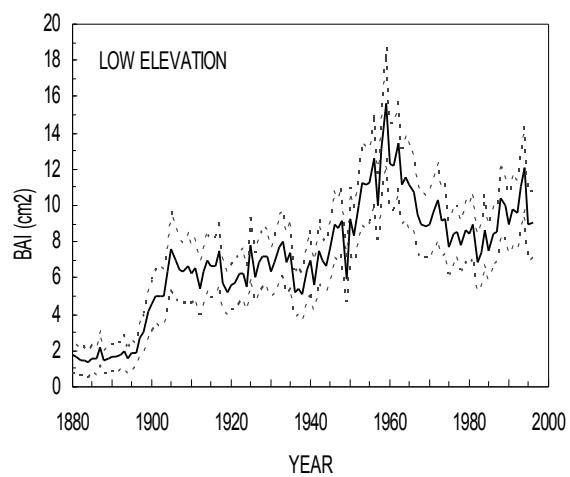

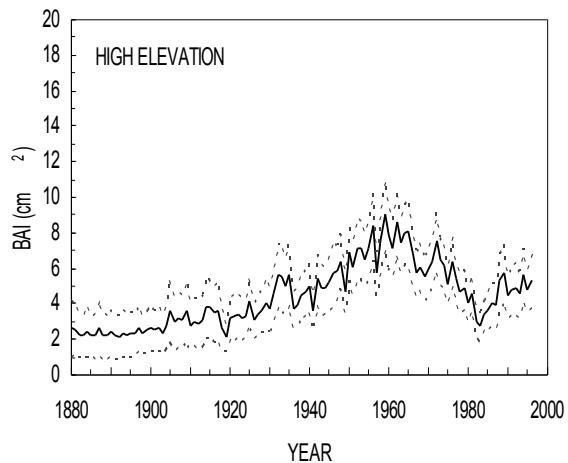

Figure 2

Figure 2. Mean annual basal area increment of red spruce. Details as in Figure 1.

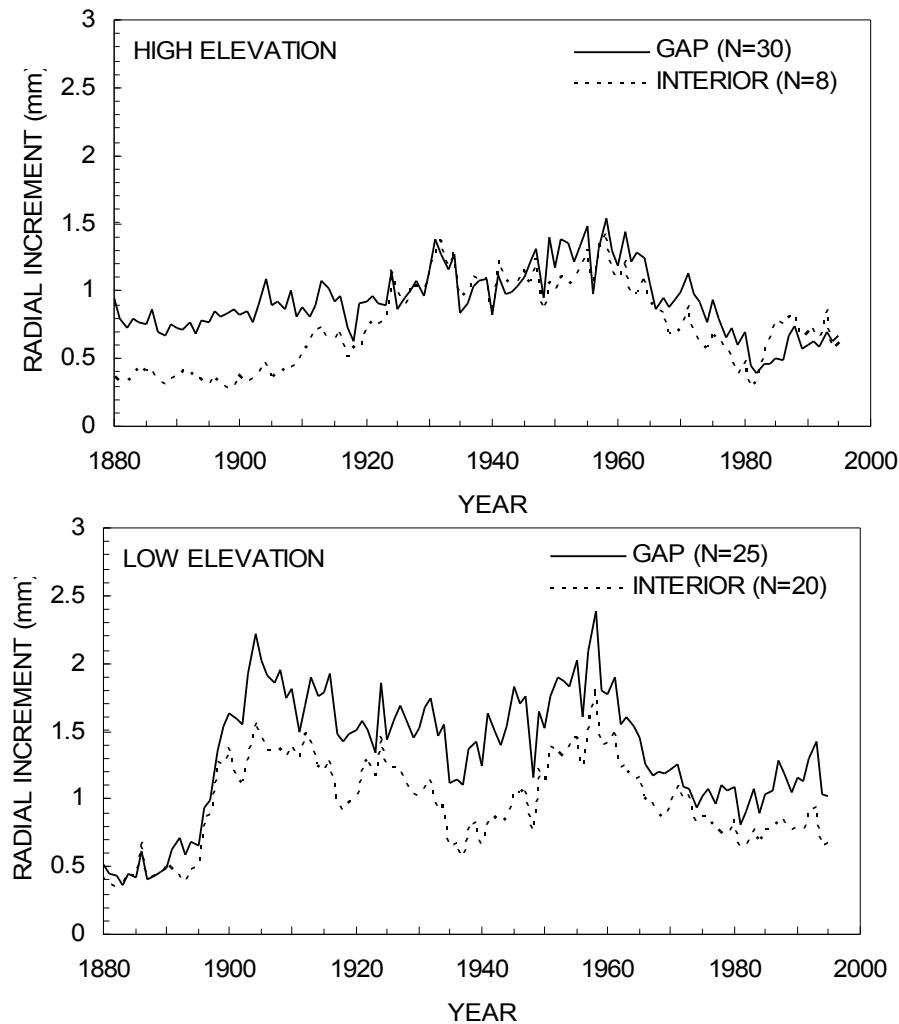

Figure 3.**Figure 3.** Mean annual radial growth of red spruce, stratified by crown exposure rating. See text for explanation of rating system. Other details as in Figure 1.

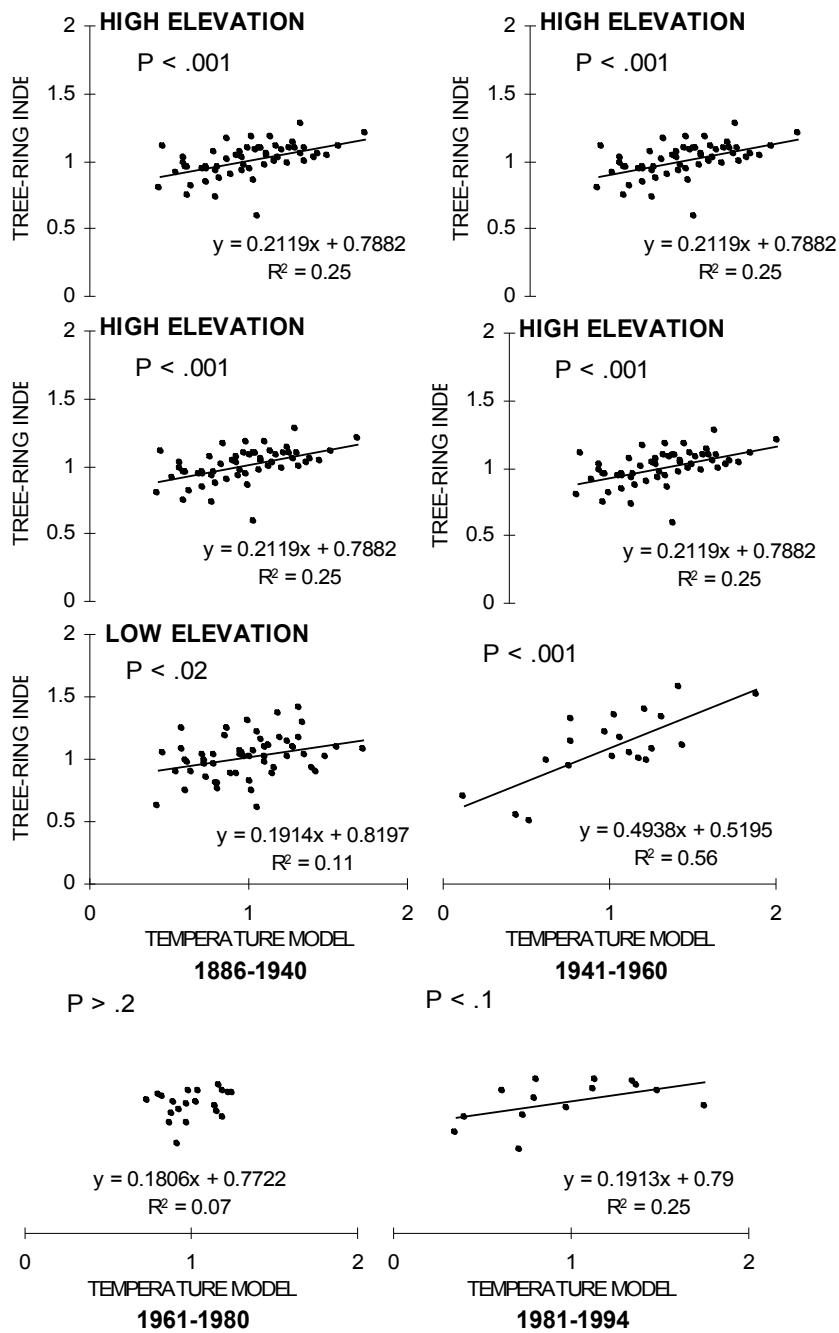

Figure 4.

Figure 4. Regression of tree-ring indices and temperature model values over four verification periods. Tree-ring indices are first-differences of mean annual radial growth across all sites. Temperature model values are first-differences of values from a multiple linear regression equation developed by Cook (1987b), which is based on regional monthly mean temperatures. Tree-ring indices and temperature model values have been scaled to a mean of 1.0 by addition of a constant.
