Benford's Law C — The Law of First Digits

&

 $P(\text{first digit} = d) \propto \log_b \left(1 + \frac{1}{d}\right)$

for certain sets of 'naturally' occurring numbers in base \boldsymbol{b}

- Around 30.1% of first digits are '1', compared to only 4.6% for '9'.
- First observed by Simon Newcomb^[3] in 1881 "Note on the Frequency of Use of the Different Digits in Natural Numbers"
- Solution Sector Sec
- Newcomb almost always noted but Benford gets the stamp, according to Stigler's Law of Eponymy. C

Benford's Law—The Law of First Digits

Observed for

- Fundamental constants (electron mass, charge, etc.)
- 🗞 Utility bills
- 🗞 Numbers on tax returns (ha!)
- 🚳 Death rates
- 🗞 Street addresses
- 🗞 Numbers in newspapers
- Cited as evidence of fraud I in the 2009 Iranian elections.

Observe this distribution if numbers are distributed uniformly in log-space:

$$P(\log_e x) \operatorname{\mathsf{d}}(\log_e x) \propto 1 \cdot \operatorname{\mathsf{d}}(\log_e x) = x^{-1} \operatorname{\mathsf{d}} x = P(x) \operatorname{\mathsf{d}} x$$
