length	1	2	2	3	3	3	3	4
$1 + \log_2 i$	1	2	2.58	3	3.32	3.58	3.81	4

PoCS, Vol. 1 Power-Law Mechanisms, Pt. 4 20 of 49

Optimization Minimal Cost Mandelbrot vs. Simon

Assumptions Model Analysis And the winner is...?

Nutshell

- $\mathbb{R}$  Word length of  $2^k$ th word:  $= k + 1 = 1 + \log_2 2^k$
- $rac{3}{2}$  Word length of *i*th word  $\simeq 1 + \log_2 i$
- Solution For an alphabet with m letters, word length of ith word  $\simeq 1 + \log_m i$ .

## Outline

#### Optimization

Minimal Cost Mandelbrot vs. Simon Assumptions Model

Analysis And the winner is.. PoCS, Vol. 1 Power-Law Mechanisms, Pt. 4 21 of 49

Optimization Minimal Cost Mandelbrot vs. Simon Assumptions

Model Analysis And the winner is...?

Nutshell

Total Cost C

 $\ref{eq: cost}$  Cost of the *i*th word:  $C_i \simeq 1 + \log_m i$ 

PoCS, Vol. 1 Power-Law Mechanisms, Pt. 4 22 of 49

Optimization Minimal Cost Mandelbrot vs. Simon Assumptions

Model Analysis And the winner is...?

Nutshell

#### Total Cost C

- $\ref{eq: cost}$  Cost of the *i*th word:  $C_i \simeq 1 + \log_m i$

#### PoCS, Vol. 1 Power-Law Mechanisms, Pt. 4 22 of 49

Optimization Minimal Cost Mandelbrot vs. Simon Assumptions

Model Analysis And the winner is...?

Nutshell

#### Total Cost C

- $\ref{eq: cost}$  Cost of the *i*th word:  $C_i \simeq 1 + \log_m i$

 $\clubsuit$  Subtract fixed cost:  $C_i' = C_i - 1 \simeq \log_m(i+1)$ 

PoCS, Vol. 1 Power-Law Mechanisms, Pt. 4 22 of 49

Optimization Minimal Cost Mandelbrot vs. Simon Assumptions

Model Analysis And the winner is...?

Nutshell

### Total Cost C

- $\mathfrak{F}$  Cost of the *i*th word:  $C_i \simeq 1 + \log_m i$

 $\ref{solution}$  Subtract fixed cost:  $C'_i = C_i - 1 \simeq \log_m(i+1)$ 

Simplify base of logarithm:

$$C_i' \simeq \log_m(i+1) = \frac{\log_e(i+1)}{\log_e m}$$

PoCS, Vol. 1 Power-Law Mechanisms, Pt. 4 22 of 49

Optimization Minimal Cost Mandelbrot vs. Simon Assumptions

Model Analysis And the winner is...?

Nutshell

## Total Cost C

- $\ref{eq: cost}$  Cost of the *i*th word:  $C_i \simeq 1 + \log_m i$
- $\ref{solution}$  Subtract fixed cost:  $C'_i = C_i 1 \simeq \log_m(i+1)$
- Simplify base of logarithm:

$$C_i' \simeq \log_m(i+1) = \frac{\log_e(i+1)}{\log_e m} \propto \log_e(i+1)$$

PoCS, Vol. 1 Power-Law Mechanisms, Pt. 4 22 of 49

Optimization Minimal Cost Mandelbrot vs. Simon Assumptions

Model Analysis And the winner is...?

Nutshell

## Total Cost C

- $\mathfrak{S}$  Cost of the *i*th word:  $C_i \simeq 1 + \log_m i$
- Cost of the *i*th word plus space:  $C_i \simeq 1 + \log_m(i+1)$

Subtract fixed cost:  $C'_i = C_i - 1 \simeq \log_m(i+1)$ 

Simplify base of logarithm:

$$C_i' \simeq \log_m(i+1) = \frac{\log_e(i+1)}{\log_e m} \propto \log_e(i+1)$$

Total Cost:

$$C \sim \sum_{i=1}^n p_i C_i' \propto \sum_{i=1}^n p_i \log_e(i+1)$$

PoCS, Vol. 1 Power-Law Mechanisms, Pt. 4 22 of 49

From the discussion at the end of Mandelbrot's paper:

A. S. C. Ross: "M. Mandelbrot states that 'the actual direction of evolution (sc. of language) is, in fact, towards fuller and fuller utilization of places'. We are, in fact, completely without evidence as to the existence of any 'direction of evolution' in language, and it is axiomatic that we shall remain so. Many philologists would deny that a 'direction of evolution' could be theoretically possible; thus I myself take the view that a language develops in what is essentially a purely random manner."

Mandelbrot: "As to the 'fundamental linguistic units being the least possible differences between pairs of utterances' this is a logical consequence of the fact that two is the least integer greater than one." PoCS, Vol. 1 Power-Law Mechanisms, Pt. 4 32 of 49

#### INTRODUCTION

The Psycho-Biology of Language is not calculated to please every taste. Zipf was the kind of man who would take roses apart to count their petals; if it violates your sense of values to tabulate the different words in a Shakespearean sonnet, this is not a book for you. Zipf took a scientist's view of language — and for him that meant the statistical analysis of language as a biological, psychological, social process. If such analysis repels you, then leave your language alone and avoid George Kingsley Zipf like the plague. You will be much happier reading Mark Twain: "There are liars, damned liars, and statisticians." Or W. H. Auden: "Thou shalt not sit with statisticians nor commit a social science."

However, for those who do not flinch to see beauty murdered in a good cause, Zipf's scientific exertions yielded some wonderfully unexpected results to boggle the mind and tease the imagination. Language is — among other things — a biological, psychological, social process; to apply statistics to it merely acknowledges its essential unpredictability, without which it would be useless. But who would have thought that in the very heart of all the freedom language allows us Zipf would find an invariant as solid and reliable as the law of gravitation? PoCS, Vol. 1 Power-Law Mechanisms, Pt. 4 35 of 49

Optimization Minimal Cost Mandelbrot vs. Simon Assumptions Model

Analysis And the winner is...?

Nutshell

Put it this way. Suppose that we acquired a dozen monkeys and chained them to typewriters until they had produced some very long and random sequence of characters. Suppose further that we defined a "word" in this monkeytext as any sequence of letters occurring between successive spaces. And suppose finally that we counted the occurrences of these "words" in just the way Zipf and others counted the occurrences of real words in meaningful texts. When we plot our results in the same manner, we will find exactly the same "Zipf curves" for the monkeys as for the human authors. Since we are not likely to argue that the poor monkeys were searching for some equilibrium between uniformity and diversity in expressing their ideas, such explanations seem equally inappropriate for human authors.

A mathematical rationalization for this result has been provided by Benoit Mandelbrot. The crux of it is that if we assume that word-boundary markers (spaces) are scattered randomly through a text, then there will necessarily be more occurrences of short than long words. Add to this fact the further observation that the variety of different words available increases exponentially with their length and the phenomenon Zipf reported becomes inescapable: a few short words will be used an enormous number of times while a vast number of longer words will occur infrequently or not at all.

So Zipf was wrong. His facts were right enough, but not his explanations. In a broader sense he was right, however, for he called attention to a stochastic process that is frequently seen in the social sciences, and by accumulating statistical data that cried out for some better explanation he challenged his colleagues and his successors to explore an important new type of probability distribution. Zipf belongs among those rare but stimulating men whose failures are more profitable than most men's successes.
