SCHOLARSHIP STATEMENT AND SCIENTIFIC CONTRIBUTIONS

I am an interdisciplinary food systems scientist that studies behavior and policy in social-ecological food systems and health. My research focus is primarily in advancing efforts to achieve sustainable food security and improve health and environmental outcomes from food systems. I am deeply committed to ensuring my academic research is available to the public and stakeholders to meet a land-grant mission, and publish in open access journals, develop research and policy briefs, and archive my research in publicly available repositories. My major career contributions to science include:

1. COVID-19 Impacts on Food Security and Food Systems: My most recent research focuses on the impact of the COVID-19 pandemic on food access, food security and health outcomes, especially in rural regions. This work began in Vermont in March 2020, but then integrated multiple institutions to implement common survey instruments and analysis. This effort grew into NFACT- The National Food Access and COVID Research Team, which currently involves 18 study sites across 15 states in the U.S. I currently serve as Director of NFACT, and we are integrating data across study sites and conducting ongoing studies and analysis. NFACT has collectively published 40 policy briefs and 10 publications since June 2020. All survey instruments are publicly available through Harvard Dataverse.

2. Food and Nutritional Security During Global Environmental Change: This work has involved mixed methods ranging from interviews to global scale models and integration of social and ecological data. The novelty of this work is in the integration of climate data with sociological data measuring food security and other human impacts, especially across scales. Emerging efforts in this area are examining how nutritional stability and diet diversity may shift with climate and other environmental changes. This work has demonstrated clear links between climate shocks/extreme events, decreased rainfall, increased temperatures, and global land grabbing on reduced food security and diet quality in both adults and children in low and middle-income countries.

3. Sustainable Food Production: My long-standing research focuses on understanding the barriers for farmers to adopt more sustainable management practices to facilitate sustainable food security and improved health and environmental outcomes. This work examines farmer's adoption of climate mitigation and adaptation practices, water management practices, nutrient management, and cover crop adoption.
