Depression is a medical illness. It is just as much an illness as are diabetes and heart disease. Depression is not a sign of being weak. It is not the person’s “fault.” A person who is depressed:

1. Feels sad.
2. Feels hopeless.
3. Feels helpless.
4. Sleeps or eats too little or too much.
5. Thinks negative thoughts.
6. Has lost interest in life.

Depression makes a person less able to manage his or her life. It affects everything from mood to behavior. Persons of all ages, races, and ethnic backgrounds get depression. In the U.S., it will affect 10 to 25 percent of women and 5 to 12 percent of men during their lifetimes.

2. Types & Symptoms

There are 3 common types. Symptoms can range from mild to severe and can last a short time or a long time.

Major Depression

This is also called clinical depression. You may have this type if, for 2 or more weeks, you have 5 or more of the symptoms listed below and on the next panel or you have 1 or 2 of the symptoms in bold type.

1. Loss of interest in things you used to enjoy. This includes sex.
2. Feeling sad, blue, or down in the dumps.
3. Feeling slowed down or restless.
4. Feeling worthless or guilty.
5. Changes in appetite. You lose or gain weight.
6. Loss of energy or feeling tired all the time.
7. Problems concentrating or thinking. It is hard for you to remember things or make decisions.
8. Trouble sleeping or sleeping too much.

You Could Also Have One or More of These Symptoms

1. Angle.
2. Headaches or other aches and pains.
3. Stomach and/or bowel problems.
5. Feeling negative, hopeless, anxious or worried.

Note: Postpartum depression is a form of major depression that occurs in the mother after giving birth. Depression symptoms last more than 2 weeks after the baby is born.

Dysthymia

This is a mild but long lasting type of depression. An adult is thought to have this type when he or she has a depressed mood for most of the day, more days than not, for at least 2 years. For children, the same is true, but the symptoms are present for at least 1 year. Besides being sad, children with dysthymia may often:

1. Be irritable, cranky, or act difficult.
2. Have low self-esteem.

Bipolar Disorder

This used to be called manic-depression. With bipolar disorder, there are feelings of extreme “highs.” With these “highs,” a person feels happy, giddy, elated, or euphoric (manic). These cycles of “highs” and “lows” can last from days to months. In between these cycles, persons with bipolar disorder can feel normal.

You may have this type of depression if you have had 4 of the symptoms below at one time for at least 1 week or you have had the symptom in bold type.

1. You feel unusually “high,” euphoric, or irritable.
2. You need less sleep.
3. You talk a lot or feel that you can’t stop talking.
4. You are easily distracted.
5. You get lots of ideas at one time.
6. You do things that feel good, but that have bad effects (e.g., foolish business ventures or unrestrained spending habits).
7. You have feelings of great happiness or elation.
8. You make lots of plans for activities (at work, school, or socially) or feel that you have to keep moving.

With dysthymia, symptoms drain the person’s energy and keep him or her from feeling good. Sometimes people with dysthymia have bouts of major depression.

3. Causes

There are several factors that may contribute to depression. Some types of depression run in families. Both genetic and environmental factors seem to play roles in depression. Depression is the most common cause of suicide.

- Elderly depressed people have higher rates of chronic medical problems, such as heart disease.
- According to one study, severely depressed people are as disabled as those disabled with a chronic physical illness.
- Studies show a link between depression and a greater chance of getting ill in people of all ages.
- Social and family life suffer. Depressed people withdraw from others. Parents who are depressed have trouble bonding to their children.
- The annual cost for treatment and lost wages due to depression is estimated at $43 to $53 billion a year.

4. Treatment

Too Often, People Don’t Get Help for Depression. They Don’t Get Help for Many Reasons:

1. They don’t know they are depressed.
2. They blame themselves for how they feel.
3. They have a hard time asking for help.
4. They don’t know what to do or where to go for help.

Why Get Help?

Over 80% of people with depression can be treated with success, usually in a short time. Here are good reasons to seek help.

1. Depression is a medical illness. It is just as much an illness as are diabetes and heart disease.
2. Depressed people have trouble bonding to their children.
3. The annual cost for treatment and lost wages due to depression is estimated at $43 to $53 billion a year.

1. What Is Depression?

Depression is a medical illness. It is just as much an illness as are diabetes and heart disease. Depression is not a sign of being weak. It is not the person’s “fault.” A person who is depressed:

- Feels sad.
- Feels hopeless.
- Feels helpless.
- Sleeps or eats too little or too much.
- Thinks negative thoughts.
- Has lost interest in life.

Depression makes a person lose ability to manage his or her life. It afflicts everything from mood to behavior. Persons of all ages, races, and ethnic backgrounds get depression. In the U.S., it will affect 10 to 25 percent of women and 3 to 12 percent of men during their lifetimes.

2. Types & Symptoms

There are 3 common types. Symptoms can range from mild to severe and can last a short time or a long time.

Major Depression

This is also called clinical depression. You may have this type if, for 2 or more weeks, you have 5 or more of the symptoms listed below and on the next panel and you have 1 or 2 of the symptoms in bold type.

- Loss of interest in things you used to enjoy. This includes sex.
- Feeling sad, blue, or down in the dumps.
- Feeling slowed down or restless.
- Having trouble falling asleep or sleeping too much.
- Feeling negative, hopeless, anxious or worried.

Dysthymia

This is a mild but long-lasting type of depression. An adult is thought to have this type when he or she has a depressed mood for most of the day, more than 2 years. For children, the same is true, but the symptoms are present for at least 1 year. Besides being sad, children with dysthymia may often:

- Be irritable, cranky, or act difficult.
- Have low self-esteem.

3. Causes

Some factors, such as chemical changes in the brain, can cause depression. Possible cause factors include:

- Emotional issues.
- Family history of depression.
- Hormonal and other changes, such as after having a baby (postpartum depression) or with menopause.
- Some types of depression run in families.
- Other factors, such as certain medical problems.
- A side effect of medicines, such as some for high blood pressure. Some antidepressant medicines may increase suicidal thoughts and attempts, especially in children and teens. This is more likely to occur early in treatment or when changing a dose.

4. Treatment

Some types of depression run in families.

- They don’t know they are depressed.
- They blame themselves for how they feel.
- They have a hard time asking for help.
- They don’t know what to do or where to go for help.

Depression is the most common cause of suicide.

Elderly depressed people have higher rates of chronic medical problems, such as heart disease.

According to one study, severely depressed people are as disabled as those disabled with a chronic physical illness.

Depression is a medical condition that affects millions of people every year. It can range from mild to severe, and it can cause significant problems in a person's life. The good news is that depression can be treated, and many people with depression have been able to regain their health.

Treatment for depression typically involves a combination of medication, therapy, and self-care. Antidepressant medications can help to relieve some of the symptoms of depression, and therapy can help to address the underlying causes of the condition.

Some people with depression may also benefit from lifestyle changes, such as getting regular exercise, eating a healthy diet, and avoiding substances that can trigger depression.

It's important to seek help if you think you may have depression. A mental health professional can help you to determine if you have depression and can develop a treatment plan that is right for you. There are many resources available to help people with depression, including support groups, hotlines, and online communities.

If you or someone you know is struggling with depression, please reach out for help. There are many effective treatments available, and getting help is the first step towards recovery.

Medicine(s). in about 3 to 6 weeks. this evens out mood. Antidepressant Antidepressants are not habit forming. best with the least side effects. Prescribed antidepressant medicines are habit forming.

Type of Psychotherapy Used for Depression

• Cognitive therapy. This focuses on thoughts and beliefs.
• Behavior therapy. This focuses on current problems in your life.
• Interpersonal therapy. This focuses on current relationships.

Psychotherapy may begin to help right away. For some people, it may take 8 to 10 weeks to show a full effect. More than half of the people with mild to moderate forms of depression do well in therapy.

C. Medicines and Psychotherapy. The medicine treats the symptoms of depression. Psychotherapy helps the patient handle the ways depression can cause or worsen problems in their lives.

D. Electro-Convulsive Therapy (ECT). Most depressions can be treated with medicine, psychotherapy, or both. ECT is mostly used for severe depression that is not helped with medicine. It can also be used for people who are severely depressed with severe medical illnesses.

E. Light Therapy. A special kind of light, called broad-spectrum light, is used. This gives people the effect of having a few extra hours of daylight each day. Special light boxes or light therapy may help people who have Seasonal Affective Disorder (SAD). This mild or moderate form of depression comes in the fall and winter.

F. Hospital Care. A person with severe depression may need to be given care in a hospital to prevent harm to himself, herself, or others. to monitor medicine(s); and/or to adjust medical therapy.

5. Self-Care

• Take medicine(s), as prescribed, even when you begin to feel better.
• Tell your doctor about side effects.

Consult your doctor before taking over-the-counter, such as MAOIs. Remember that alcohol and/or drugs can make medicines for depression less effective. Harmful side effects can happen if you combine alcohol and/or medicines with medicine.

Attend support groups, such as ones for new mothers who have postpartum depression.

Know that negative thinking is part of depression. As the depression lifts, the negative thoughts will lift, too.

Don’t make major decisions during bouts of depression. Ask someone you trust to help you.

Eat healthy foods. Eat at regular times.

Exercise regularly.

Eat healthy foods. Eat at regular times.

Don’t make major decisions during bouts of depression. Ask someone you trust to help you.

6. Reasons to Call Doctor or Health Care Provider

Immediate Care

• Alcohol or drug abuse.
• Taking over-the-counter or prescribed medicine.
• A medical problem.

• You dwell on past holidays to the point that it ruins your current holiday spirits.

• You feel depressed now and one or more of these things apply:
— You have been depressed before and did not get treatment.
— You have been treated (with or without medicine) for depression in the past and it has come back.
— Any of these problems occur during holiday times:
  ▪ You withdraw from family and friends.
  ▪ You dwell on past holidays to the point that it ruins your current holiday spirits.

• Social situations or activities that could be used for suicide and get medical help.

7. Reasons to Get Immediate Care

• Symptoms of major depression occur. (See topic 2.)

Depression has kept you from doing daily activities for more than 2 weeks or you withdraw from normal activities for more than 2 weeks.

Depression results from one of these things:
— A medical problem.

• Taking over-the-counter or prescribed medication. (This includes an antidepressant.)
• Alcohol or drug abuse.
• Grieve over the loss of a loved one does not start to improve after a couple of months.

Depression doesn’t lift until 2 weeks after having a baby.

Depression comes with dark, cloudy weather or winter months. It lifts when spring comes.

You feel depressed now and one or more of these things apply:
— You have been depressed before and did not get treatment.
— You have been treated (with or without medicine) for depression in the past and it has come back.

Any of these problems occur during holiday times:
— You withdraw from family and friends.
— You dwell on past holidays to the point that it ruins your current holiday spirits.

Types of Medicines for Depression

These are in groups based on their chemical makeup or how they affect brain chemistry.

SSRls: These medicines alter serotonin, a chemical in the brain that affects mood, sleep, appetite, etc. They are many brand name and generic names.

SNRls: These medicines alter serotonin and another brain chemical called norepinephrine.

NDRls: These medicines alter norepinephrine and another brain chemical called dopamine.

TCAs: These medicines alter serotonin and another brain chemical.

MAOIs: Persons who take MAOIs must follow a special diet. It is needed because some foods, if taken with MAOIs, can cause a high blood pressure crisis. Examples are aged cheeses and red wine. Because of this and other reasons, MAOIs are not used often.

Lithium: This is used to treat bipolar disorder. Lithium reduces both manic and depressive episodes. When periods occur, they are less severe in most persons who take lithium.

Medicare used to treat acute mania in bipolar disorder.

Over-the-counter herbal remedies, such as SAMe and St. John’s Wort for mild to moderate depression. Consult your doctor before taking these.

It may take some time to find the medicine that works best with the least side effects. Prescribed antidepressant medicines are not habit forming.

B. Psychotherapy: A therapist listens and helps you deal with your problems. This treatment is usually brief. Ten to 20 visits is common. This type of therapy can be done with:

• Just you and the therapist. This is one-on-one therapy.
• You, the therapist, and other people with similar problems. This is group therapy.
• You, the therapist, and family members, loved ones, or a partner. This is family or marriage therapy.

C. Medicine and Psychotherapy. The medicine treats the symptoms of depression. Psychotherapy helps the patient focus their thoughts and behaviors.

D. Electro-Convulsive Therapy (ECT): Most depressions can be treated with medicine, psychotherapy, or both. ECT is mostly used for severe depression that is not helped with medicines. It can also be used for persons who are severely depressed with severe medical illnesses.

E. Light Therapy. A special kind of light, called broad-spectrum light is used. This gives people the effect of having a few extra hours of daylight each day. Special light boxes or light therapy may help people who have Seasonal Affective Disorder (SAD). This mild or moderate form of depression comes in the fall and winter.

F. Hospital Care. A person with severe depression may need to be given care in a hospital to prevent harm to himself, herself, or others; to monitor medicine(s); and/or to adjust medical therapy.

5. Self-Care

A. Avoid over-the-counter herbal remedies, such as SAMe and St. John’s Wort for mild to moderate depression. Consult your doctor before taking these.
