

Minor in Anthropology with Global Health Focus

Students interested in human health and its variation within and across different populations, cultures, and societies will want to consider tailoring their major or minor in Anthropology to focus on global health. The Anthropology Department offers a variety of courses centered on biological and cultural anthropology and related to the body and health in varying cultural, social, and environmental settings. These courses are designed for students with an interest in biological anthropology, medical anthropology, diversity and health, and public and global health.

We offer three different courses of study in this area, ranging from the most in-depth Anthropology Major with a Global Health Focus, to two options requiring fewer courses in related topics, including a Major Concentration in the Anthropology of Global Health, and an Anthropology Minor with a Global Health Focus. Students who complete the most in-depth Anthropology Major with a Global Health Focus option may also design their plan of study to complete the Major Concentration in the Anthropology of Global Health along the way.
