```
"""
Demonstration of a function
"""

def f(x):
    return x ** 2 - 1

if __name__ == '__main__':

    y = f(12)
    print(y)

    y = f(5)
    print(y)
```

Here we define the function.
At this point, x does not have a value,
and this code is not executed.
